DECLARATION

I, **Vicnashvere Moodley** declare that:

i. The research reported in this dissertation/thesis; except where otherwise indicated, is my original research.

ii. This dissertation/thesis has not been submitted for any degree or examination at any other university.

iii. This dissertation/thesis does not contain other person's data, pictures, graphs or other information, unless specifically acknowledged as being sourced from other persons.

iv. This dissertation/thesis does not contain other persons' writing, unless specifically acknowledged as being sourced from other researchers. Where other written sources have been quoted, then:

   a. their words have been re-written, but the general information attributed to them has been referenced.

   b. where their exact words have been used, their writing has been placed inside quotation marks and referenced.

v. Where I have reproduced a publication of which I am the author, co-author or editor, I have indicated in detail which part of the publication was written by me alone and have fully referenced such publication.

vi. This dissertation/thesis does not contain text, graphics or tables copied and pasted from the Internet, unless specifically acknowledged, and the source being detailed in the dissertation/thesis and in the References sections.

Vicnashvere Moodley

ACKNOWLEDGEMENT

The journey to get to the point of the submission of the dissertation and completion of the coursework has been humbling. It has taken dedication and perseverance that floundered at times, I held myself to account and reached out to my strong, reliable network for support. The support also came from individuals (research students) that I had met by chance that encouraged me and ensured that I was supported through the process.

I am particularly grateful for the support provided by my employer and colleagues, who provided invaluable flexibility and encouragement, allowing me the necessary time and mental space to focus on my studies. The Master class students and their ability to want to support each other and the level of engagement showed the calibre of professionals in our field and their ability to pull the individuals through the degree.

My supervisor, Dr Anyetei Ako-Nai, thank you for the guidance on this journey which was challenging from the onset but rewarding. Your approach on the review of the dissertation was tough but made me eager to want to deliver the right quality.

To my family, my husband that always believes in me and his faith in my ability is unwavering, my parents for trusting me and being silently proud of me no matter the outcome; and my brother for being a tough and non-competitive supporter.

I look forward to applying the knowledge gained throughout this journey.

ABSTRACT

This empirical study investigates the influence of digital transformation (DX) constructs on knowledge management (KM) implementation at Associated British Foods (ABF) Sugar Africa. Despite significant organisational investment in digital technologies, many enterprises face persistent challenges in achieving effective KM adoption, including fragmented knowledge silos, resistance to change, and misalignment between digital strategies and organisational knowledge practices.

To address this gap, the research employs a quantitative methodology to examine how seven DX constructs, leadership, culture, technology, innovation, change, people, and experiences, shape four KM pillars: leadership, organisation, technology, and learning. Through descriptive statistics, correlation analysis, multiple regression analysis, exploratory factor analysis, and structural equation modelling, the study develops an empirically validated predictive model of KM implementation effectiveness in digitally transforming environments. Data were collected from 131 managerial and supervisory employees across five African operations and analysed using descriptive statistics, correlation analysis, multiple regression analysis, exploratory factor analysis, and partial least squares structural equation modelling (PLS-SEM). The study develops an empirically validated predictive model of KM implementation effectiveness in digitally transforming environments which explains 64.6% of the variance in KM implementation effectiveness ($R^2 = 0.646$).

Findings reveal that specific DX constructs, particularly leadership, people capability, and innovation (modelled as a combined construct), significantly predict KM success across multiple dimensions, collectively explaining a substantial proportion of variation in KM implementation effectiveness ($R^2 = 0.646$). In particular, the combined DX leadership, people, and innovation construct emerged as the strongest predictor ($\beta = 0.470$, $p < 0.001$), followed by DX technology ($\beta = 0.398$, $p < 0.001$), while organisational culture was found to play an important moderating role in strengthening the relationship between digital technologies and KM capabilities ($\beta = 0.120$, $p = 0.018$). The research contributes theoretically by advancing scholarly understanding of DX–KM interplay through empirical validation and practically by providing evidence-based guidance for organisations seeking to align digital initiatives with knowledge management practices. The

integrated framework offers a quantitatively validated blueprint for practitioners across African organisational contexts and beyond, ensuring that KM becomes embedded as a core strategic capability within digital transformation initiatives.

CHAPTER ONE: INTRODUCTION

1.1 Introduction

In today's dynamic digital economy, knowledge has become a core strategic asset. Organisations that can effectively manage knowledge are better positioned to innovate, make data-driven decisions, and respond to market disruptions. Knowledge Management (KM) plays a pivotal role in enhancing organisational competitiveness by enabling the systematic acquisition, storage, dissemination, and utilisation of information. With the advent of Digital Transformation (DX), the strategic integration of digital technologies across business functions, the way knowledge is created, shared, and applied has fundamentally changed (Machado, 2021; Erceg & Zoranović, 2021). In digitally transforming environments, DX constructs such as leadership, culture, technology, change, innovation and people directly influence how KM systems are designed, adopted, and sustained. DX leadership, in particular, shapes KM implementation by embedding it into strategic vision, aligning it with digital priorities, allocating resources, and fostering an organisational culture open to knowledge sharing and continuous learning.

Whereas digital tools offer new opportunities for collaboration and real-time knowledge exchange, the implementation of KM in a DX deployment environment is not straightforward. Culture, leadership, innovation, organisational learning, and change management remain complex variables that determine whether KM thrives or fails (Nonaka & Takeuchi, 1995; Alavi & Leidner, 2001; Schein, 2017). Understanding how DX constructs influence KM constructs, rather than viewing them as separate domains, is essential for realising the strategic benefits of digital transformation. This study contributes to the fields of Information Systems and Technology (IS&T) and KM by quantitatively examining how organisational factors, shaped by DX, influence KM implementation at ABF Sugar Africa. It aims to produce a predictive model that can guide organisations in aligning digital strategies with knowledge practices for improved performance and sustainability.

The exponential growth of digital technologies has accelerated the generation, sharing, and use of organisational knowledge. However, many organisations including ABF Sugar Africa, continue to face persistent challenges such as siloed data, ineffective knowledge-sharing mechanisms, and resistance to technological change (Starmind, 2022; Forrester Consulting, 2024). These challenges

often stem from a failure to align DX initiatives particularly DX leadership, culture, and people strategies, with the organisational factors that underpin KM implementation.

In a DX deployment environment, the pillars of DX, people, change, innovation, leadership, technology, and culture, provide the strategic and operational context within which KM is implemented (Lovrenčić & Sekovanić, 2019). Each of these DX constructs directly influences one or more of the four pillars of KM, leadership, organisation, technology, and learning. DX leadership to KM leadership, shapes the KM vision, embeds it in strategic priorities, and champions cultural change that supports knowledge sharing. DX technology to KM technology, provides the infrastructure such as cloud, big data analytics, AI-powered search, that enables advanced knowledge capture, retrieval, and collaboration. DX culture to KM organisation and learning, encourages openness, trust, and a learning mindset, creating an environment where knowledge is shared freely. DX innovation and change to KM learning, drives continuous improvement in KM processes by capturing lessons learned from digital initiatives and adapting practices accordingly. DX people to KM organisation and leadership, ensures that KM processes meet the needs of both employees and customers, making knowledge relevant and actionable.

The decision to focus on these specific constructs, people, change, innovation, leadership, technology, and culture is informed by two key considerations. First, literature on DX consistently identifies these as critical enablers of transformation success (Newman & Blanchard, 2017; Erceg & Zoranović, 2021). Second, empirical KM research shows that these factors have a measurable impact/influence on KM adoption, sustainability, and value creation (Becerra-Fernandez & Sabherwal, 2010; Khilji, Nikolic & Rehman, 2024). By narrowing the study to these interlinked constructs, the research targets the organisational levers most likely to influence KM outcomes in a digitally transforming enterprise. The integration of technologies such as cloud computing, big data analytics, and collaboration platforms such as Microsoft Teams and Slack platform, with KM systems has reshaped how knowledge is accessed and applied (Erceg, 2021; Vuchkovski et al., 2023). Yet, technology alone does not guarantee KM success. Studies indicate that 24% of employees' time is spent searching for information, 22% of data must be manually cleaned before use, and 25% remains locked in silos (Forrester Consulting, 2024). These inefficiencies are not

solely technological limitations but often the result of leadership misalignment, cultural barriers, and insufficient change readiness within the DX environment.

Therefore, there is a clear need for a data-driven model that examines KM implementation through the lens of DX constructs, ensuring that people, change, innovation, leadership, technology, and culture readiness are embedded into digital strategies to maximise KM impact. This study addresses this need by providing both academic and practical insights into how KM can be effectively implemented and sustained when shaped by DX leadership and its associated constructs.

ABF Sugar Africa is the African sugar division of Associated British Foods plc (ABF), a multinational diversified food, ingredients, and retail group headquartered in the United Kingdom. ABF Sugar Africa operates integrated sugar value chains across several African countries, including South Africa, Malawi, Zambia, Tanzania, and Eswatini. Its operations span agricultural production, milling and refining, supply chain management, sales and marketing, and supporting corporate and shared services functions. These geographically distributed and functionally diverse operations generate significant volumes of data and operational knowledge across the agricultural, manufacturing, logistics, and commercial domains.

As a capital-intensive and knowledge-dependent agribusiness, ABF Sugar Africa operates in an environment characterised by market volatility, regulatory complexity, climate variability, and increasing efficiency pressures. Operational decision-making depends heavily on timely access to accurate agronomic data, production insights, supply chain intelligence, and institutional knowledge embedded within employees and systems. Consequently, both digital transformation (DX) and knowledge management (KM) are critical enablers of organisational resilience, operational efficiency, and strategic responsiveness within the group.

In recent years, ABF Sugar Africa has progressively invested in digital technologies such as enterprise resource planning (ERP) systems, data analytics platforms, collaboration tools, and digital agricultural solutions to modernise operations and improve decision-making. These DX initiatives aim to enhance process visibility, standardisation, automation, and cross-country

integration. However, the effectiveness of such digital investments is contingent on the organisation's ability to capture, share, and apply knowledge derived from digital systems, operational experiences, and human expertise.

Knowledge management plays a pivotal role in this context by enabling the systematic codification of agronomic know-how, operational best practices, lessons learned from projects, and managerial insights generated through day-to-day operations and digital platforms. When effectively integrated with DX initiatives, KM supports organisational learning, reduces knowledge silos across geographically dispersed operations, and enhances the reuse of expertise across business units. Conversely, weak alignment between DX initiatives and KM practices risks fragmented knowledge flows, underutilisation of digital platforms, and loss of critical institutional knowledge, particularly in a multi-country organisation such as ABF Sugar Africa.

Accordingly, ABF Sugar Africa provides an appropriate organisational context for examining the extent to which DX constructs, such as leadership, culture, people capabilities, change management, innovation, and technology shape the effectiveness of KM implementation. Understanding this relationship is particularly important in African multinational enterprises, where digital transformation is accelerating, yet empirical evidence linking DX initiatives to KM outcomes remains limited.

1.2 Research problem

Although there is broad consensus that DX accelerates the evolution of KM, empirical studies that quantify the influence of DX constructs on KM implementation are limited, particularly in organisational context (Erceg & Zoranović, 2021). Digital transformation is widely understood to accelerate the evolution of knowledge management; however, Erceg and Zoranović (2021) found that existing research is largely conceptual or qualitative, with limited quantitative, organisation-level evidence. They highlight a lack of statistically validated models measuring how specific DX constructs influence KM implementation, underscoring a clear empirical research gap.

In particular, the effects of people, change, innovation, leadership, technology, and culture, when embedded in a DX deployment environment, on KM implementation remain underexplored in

measurable terms. Despite significant investment in digital tools, organisations like ABF Sugar Africa face persistent KM adoption challenges, including resistance to change despite new platforms, fragmented and siloed knowledge-sharing systems and misalignment between DX leadership vision and organisational culture (Forrester Consulting, 2024; Erceg & Zoranović, 2021). These challenges point to a deeper issue like the absence of empirical models linking DX constructs to KM outcomes in real-world organisational contexts. Without such models, DX efforts may fail to produce sustainable knowledge ecosystems.

This study addresses this gap by employing a quantitative research approach to measure the influence of selected DX-related variables, culture, change, leadership, learning, and innovation on KM implementation at ABF Sugar Africa. The goal was to develop a data-driven framework to help organisations design DX strategies that actively enhance KM effectiveness.

1.3 Research objectives

The aim of this study was to empirically investigate how DX constructs influence KM implementation at ABF Sugar Africa. To achieve this, the study pursued the following objectives:

1. To determine the influence of DX leadership on KM leadership in implementation at ABF Sugar Africa.
2. To examine the influence of DX culture on KM organisation.
3. To assess the influence of people on KM organisation.
4. To examine the relationship between DX change and KM learning
5. To evaluate the influence of DX innovation on KM learning.
6. To assess the influence of DX technology on KM technology capabilities at ABF Sugar Africa.
7. To develop a predictive model of KM implementation effectiveness enabled by DX constructs.

1.4 Research questions

The following research questions will guide the empirical investigation:

1. How does DX leadership influence KM leadership at ABF Sugar Africa?
2. What is the influence of DX culture on KM organisation?
3. How do people-related factors influence KM organisation?

4. What is the relationship between DX change and KM learning?
5. How does DX innovation influence KM learning?
6. How does DX technology influence KM technology capabilities at ABF Sugar Africa?
7. What key DX constructs predict overall KM implementation effectiveness?

1.5 Research hypothesis

In line with the quantitative research design adopted in this study, the investigation proceeds beyond descriptive inquiry to the formal testing of theoretically derived relationships. Quantitative research requires the explicit formulation of hypotheses to translate conceptual propositions into empirically testable statements, thereby enabling statistical examination of relationships between variables.

The research questions identify the key relationships of interest between digital transformation (DX) constructs and knowledge management (KM outcomes). These questions are operationalised through formal hypotheses, which specify the expected direction and significance of each relationship and provide the foundation for regression analysis, mediation and moderation testing, and structural equation modelling.

The hypotheses establish the basis for statistical testing by defining measurable relationships that can be empirically accepted or rejected. Collectively, they enable the assessment of both individual and integrated effects of DX constructs on KM implementation effectiveness, ensuring analytical coherence between the research problem, objectives, questions, and quantitative methods applied in the study.

Based on the research problem, objectives, and research questions, the following hypotheses were formulated for empirical testing:

- H1: DX Leadership positively influences KM Leadership implementation at ABF Sugar Africa.
- H2: DX Culture positively influences KM Organisation structures and processes.
- H3: People capabilities positively influence KM Organisation effectiveness.
- H4: DX Change management positively influences KM Learning capabilities.
- H5: DX Innovation significantly enhances KM Learning and knowledge asset renewal.
- H6: DX Technology positively strengthens KM Technology capabilities and infrastructure.

- H7: Integrated DX constructs collectively predict overall KM implementation effectiveness at ABF Sugar Africa.

1.6 Rationale of the study

The accelerating adoption of digital technologies has led to a global surge in DX initiatives across industries. These initiatives are often recognised for their potential to improve efficiency, agility, and competitiveness. However, their specific influence on KM implementation remains insufficiently understood, particularly from a quantitative, organisational perspective. According to (Kallmuenzer et al., 2024, Hafeez et al., 2025), much of the existing research has focused either on conceptual frameworks or qualitative insights, leaving a lack of measurable evidence on how DX constructs, such as leadership, culture, innovation, change, people, and technology, shape the four KM constructs of leadership, organisation, technology, and learning.

This gap is particularly critical in contexts such as ABF Sugar Africa, where digital initiatives are being deployed to modernise operations, but challenges persist in ensuring effective knowledge flow, organisational learning, and collaboration. Without a deeper empirical understanding, organisations risk investing in digital tools that do not translate into improved knowledge processes, leading to fragmented knowledge silos, resistance to change, and missed opportunities for innovation. The rationale for this study rests on two interlinked dimensions. Theoretical, the fields of IS&T and KM require robust, empirically tested models that demonstrate how DX constructs influence KM outcomes. While previous studies have acknowledged the interplay between DX and KM, few have moved beyond descriptive accounts to offer quantitative, statistically validated evidence. By empirically testing these relationships, this study responds directly to the scholarly gap, advancing both DX and KM theory.

Practical, organisations need evidence-based insights to align their digital strategies with KM practices. By identifying statistically significant DX factors that enable or hinder KM implementation, this study provides practical guidance for managers and decision-makers on policy formulation, training, cultural change initiatives, and technology adoption strategies. In addressing this gap, the study goes beyond examining DX as a purely technological initiative and instead positions it as an environmental context that shapes KM implementation. By focusing on

the influence of DX constructs on KM constructs, the research develops and validates a predictive model that identifies which factors most significantly drive KM success in digitally transforming organisations. This rationale not only justifies the need for the study but also underscores its dual contribution, advancing academic knowledge through empirical validation and enhancing organisational practice through actionable insights. At the conclusion of the analysis, the study will present a tested model showing the significant DX environmental factors that influence successful KM implementation, offering a framework that future scholars can build upon and that practitioners can apply in real-world DX initiatives.

1.7 Significance of the study

This study contributes to the advancement of academic knowledge and organisational practice in the domains of IS&T and KM. It moves beyond descriptive inquiry by quantitatively investigating how DX influences KM practices through the lens of key organisational variables. From a theoretical perspective, the study adds empirical evidence to the growing body of literature on the intersection of DX and KM. It develops and validates a conceptual model that maps the relationships between DX constructs (leadership, culture, innovation, technology, people and change) and the four KM constructs (leadership, organisation, technology, and learning) in digitally transforming environments. At the end of the analysis, this model will highlight the statistically significant DX factors that influence successful KM implementation, offering a foundation for further theory-building and scholarly debate.

From a practical perspective, the study offers actionable insights for organisations embarking on or refining their DX journeys. By identifying the significant enablers and barriers to KM implementation, it equips decision-makers with evidence-based guidance for policy development, training programmes, change management strategies, and technology alignment. Such insights are critical for improving knowledge-sharing, fostering innovation, and enabling data-driven decision-making, ultimately enhancing organisational agility, competitiveness, and resilience. The study also has sectoral value, as its findings can inform stakeholders across both public and private domains, particularly in knowledge-intensive industries, on how best to integrate KM practices within their digital strategies. Additionally, the study has pedagogical value for academic institutions by providing empirical evidence and a predictive model of DX–KM interplay. This

can enrich IS&T and KM curricula, strengthen research training, and provide regionally relevant case material that bridges global theory with African organisational practice. This study contributes to future empirical research by offering a validated model and dataset that can be built upon by scholars seeking to explore the nuanced dynamics between DX and KM through rigorous quantitative approaches.

1.8 Overview of the study

This dissertation is structured into six chapters, each of which builds systematically towards addressing the research problem and achieving the stated objectives. Chapter Two presents the Literature Review, which offers a comprehensive account of prior research on KM, DX, and their points of intersection. The chapter not only synthesises theoretical perspectives and empirical findings but also identifies gaps in the existing literature. By doing so, it provides the conceptual foundation for the study and justifies the need for examining how DX constructs influence KM implementation within ABF Sugar Africa. Chapter Three sets out the Research Methodology adopted in the study. It describes the research design, population and sampling methods, data collection instruments, and analytical techniques used to address the research questions. This chapter also provides justification for adopting a quantitative approach and explains how validity, reliability, and ethical considerations were maintained throughout the study.

Chapter Four presents the Data Analysis and Results. It begins with the presentation of descriptive statistics, offering an overview of the collected data. Thereafter, it provides detailed statistical analysis, including tests of the hypothesised relationships between DX constructs and KM constructs. The chapter culminates in the presentation of key findings, linking them back to the research questions and objectives. Chapter Five discusses the Findings in depth. Here, the statistical results are interpreted in light of the research questions, hypotheses, and existing literature. This chapter highlights both confirmations and deviations from prior studies, providing critical insights into the interplay between DX and KM. It also elaborates on the theoretical and practical contributions of the study.

Chapter Six concludes the dissertation by offering a summary of the key findings and reflecting on their implications for both practice and theory. The chapter further provides actionable

recommendations for practitioners in the fields of IS&T and KM, outlines the limitations of the current study, and suggests directions for future research. In doing so, it closes the loop between research, practice, and ongoing inquiry into how digital transformation shapes the implementation of knowledge management in African organisational contexts.

1.9 Chapter summary

This chapter introduced the study by underscoring the importance of knowledge as a strategic resource in the modern digital era. It emphasised how organisations such as ABF Sugar Africa increasingly rely on KM to enhance decision-making, collaboration, and innovation, particularly within the context of DX. The chapter established the research's contribution to the fields of IS&T and KM, highlighting the need to align digital strategies with organisational knowledge processes to remain competitive and agile. The background contextualised the study by identifying persistent challenges in KM implementation, including fragmented knowledge silos, limited employee engagement, and resistance to change, despite advancements in digital tools. These challenges illustrate that technology alone cannot guarantee KM success; rather, organisational variables such as leadership, culture, change, innovation, and learning must be understood within the broader DX environment.

The research problem was articulated as a lack of empirical studies that quantitatively measure how DX constructs influence KM constructs in digitally transforming organisations. To address this gap, the chapter presented seven research questions and aligned objectives designed to test these relationships and ultimately develop a predictive model of KM implementation effectiveness under DX. The rationale for the study was justified by pointing to both knowledge gaps in the literature and practical challenges facing organisations such as ABF Sugar Africa. The significance of the study was highlighted across academic, practical, and pedagogical domains. Theoretically, it contributes empirical evidence to the growing body of literature on the interplay between DX and KM, validating a conceptual model that maps their interrelationships. Practically, it identifies statistically significant DX enablers and barriers that influence KM success, providing evidence-based insights to guide policy, training, change management, and technology strategies. Pedagogically, it enriches IS&T and KM curricula by offering empirical case material, a validated

predictive model, and methodological clarity that can strengthen academic teaching and research training.

At the conclusion of the analysis, the study will present a model identifying the significant DX environmental factors that most strongly influence KM implementation, thereby advancing both scholarly inquiry and managerial practice. The next chapter will critically engage with the existing literature on DX and KM, synthesise theoretical and empirical studies, and present the conceptual and theoretical framework guiding this investigation.

CHAPTER TWO: LITERATURE REVIEW

2.1 Introduction

This chapter presents a critical review of the theoretical and empirical literature relating to DX and KM. The purpose is to understand the concepts, models, practices, and interplay of KM and DX, identify critical success factors, and establish the research gap. his chapter is structured into theoretical underpinnings, empirical findings, and thematic areas essential for this study's quantitative approach.

2.2 Empirical literature review

2.2.1 Knowledge Management practices and systems

KM has evolved from a support function into a strategic discipline central to organisational performance, competitiveness, and innovation. Empirical studies consistently identify four core KM processes, knowledge creation, organisation, sharing, and application, that collectively generate value and sustain competitive advantage (Martins et al., 2019; Mohajan, 2017). These processes are increasingly enabled by Knowledge Management Systems (KMS), which integrate information and communication technologies (ICTs) to capture, structure, disseminate, and apply knowledge across the organisation. Importantly, the effectiveness of these processes is not solely determined by technology but also by organisational culture, leadership, and alignment with DX strategies.

2.2.1.1 Knowledge creation

Knowledge creation refers to the generation of new ideas, insights, and solutions through individual and collective learning. Empirical research demonstrates that organisations investing in mechanisms such as research and development (R&D), innovation hubs, and communities of practice achieve greater adaptability and market responsiveness (Song, Li & Zhao, 2019). Nonaka and Takeuchi’s (1995) SECI model is widely applied in empirical KM studies to explain the conversion of tacit knowledge (skills, experience, intuition) into explicit knowledge (documents, reports, systems) as a pathway to innovation. For example, Ribeiro et al. (2022) found that in Industry 4.0 environments, effective knowledge creation processes integrate employee expertise with customer feedback to enhance product innovation and responsiveness.

While the literature demonstrates that knowledge creation is central to organisational competitiveness and innovation, particularly in digitally enabled environments, much of the existing research remains conceptual or qualitative in nature. There is limited empirical evidence quantifying how digital transformation constructs systematically influence knowledge creation as part of KM implementation in organisational contexts. This gap motivates the present study to quantitatively examine how selected DX constructs shape KM practices, including knowledge creation, within a digitally transforming organisation.

2.2.1.2 Knowledge organisation

Knowledge organisation involves structuring and classifying knowledge into accessible repositories and systems. Well-organised knowledge repositories reduce duplication, improve discoverability, and support timely decision-making (Martins et al., 2019). Conversely, poor structuring can result in information overload and knowledge loss, particularly in geographically dispersed organisations. Igbinovia and Ikenwe (2018) emphasise the importance of metadata, indexing, and taxonomies in making knowledge discoverable, while studies confirm that such systems significantly enhance user satisfaction and knowledge retrieval. In digitally transforming firms, the ability to organise knowledge effectively has become even more crucial, as organisations integrate large volumes of data from multiple platforms into unified KMS.

Although prior studies emphasise the importance of structuring, classifying, and codifying organisational knowledge to enhance accessibility and reuse, empirical research linking digital transformation initiatives to effective knowledge organisation remains fragmented. In particular, there is limited quantitative evidence demonstrating how DX-related organisational enablers influence knowledge organisation practices within integrated KM systems. Addressing this gap, the current study investigates the influence of DX constructs on KM organisational capabilities in a multi-country organisational context.

2.2.1.3 Knowledge sharing

Knowledge sharing is the process of exchanging knowledge between individuals, teams, departments, forums, and other platforms, both internally and externally. Technical platforms such

as intranets and collaboration tools facilitate this process. However, research shows that the success of knowledge sharing is strongly influenced by organisational culture and leadership. Akhavan et al. (2014) found that participatory and innovative cultures, along with supportive leadership styles, significantly enhance knowledge sharing. Lam et al. (2021) similarly demonstrates that collaborative and inclusive cultures especially those fostering participative and supportive leadership are positively associated with effective knowledge management and innovation capability. Nguyen et al. (2023) argues that digitalisation enhances technology transfer only when supported by strong inter-organisational collaboration. Their findings imply that without strategic alignment and collaborative mechanisms, digital tools may be underutilised and fail to facilitate effective knowledge exchange between organisations.

Martins et al. (2019), in their review of KM in the context of sustainability, highlight structural barriers such as fragmentation and lack of shared goals but do not address leadership influences revealing a gap in how leadership and culture intersect to support sustainable knowledge sharing. Collectively, these studies underscore that while digital platforms can support knowledge exchange, their impact is contingent on a culture of trust and leadership that encourages openness, participation, and cross-functional collaboration, yet further research is needed to fully understand how these elements interact across diverse organisational contexts.

Existing literature highlights that knowledge sharing is strongly influenced by cultural, technological, and leadership factors; however, empirical studies often treat these influences in isolation or rely predominantly on qualitative insights. There remains a lack of integrated, quantitative models assessing how digital transformation constructs collectively affect knowledge sharing as a core KM outcome. This limitation informs the present study's focus on empirically testing the relationships between DX constructs and KM implementation outcomes.

2.2.1.4 Knowledge application

The final stage of KM involves applying knowledge to decision-making, problem-solving, and performance improvement. Empirical studies confirm that organisations that systematically apply knowledge achieve better outcomes in efficiency, customer satisfaction, and innovation capacity (Mohajan, 2017; Davenport & Prusak, 1998). Knowledge application transforms insights into

tangible business value, particularly when facilitated through mechanisms such as lessons-learned databases, after-action reviews, and decision-support systems (Ekambaram, 2018). In digital contexts, KM application increasingly relies on analytics-driven decision-making, where real-time insights are translated into strategic and operational actions.

However, the successful application of knowledge is not solely dependent on technological infrastructure. Swaty & Kumar (2021) argue that KM application requires cultural transformation and organisational commitment; technology alone is insufficient. Similarly, Imhanzenobe et al. (2021) highlight that KM effectiveness depends on intellectual capital, innovation, and strategic alignment, while pointing to cultural differences and poor information structures as key barriers. These perspectives are echoed by Santhose & Noble (2023), whose systematic review identifies a range of behavioural and structural inhibitors to KM application. These insights suggest that while digital tools and structured systems are essential, the realisation of KM's value ultimately depends on human engagement, cultural alignment, and strategic integration.

2.2.1.5 Knowledge Management Systems

Knowledge Management Systems (KMS) form the technological foundation for knowledge management processes by facilitating knowledge acquisition, storage, retrieval, and dissemination. Empirical research underscores that effective KMS implementation requires the seamless integration of hardware components, such as servers, data centres, and devices, alongside software solutions, including content management systems, knowledge repositories, AI-driven analytics, and collaboration platforms like Microsoft Teams or SharePoint (Igbinovia & Ikenwe, 2018; Lindvall et al., 2001). Lindvall's Knowledge Management Architecture Model, which segments KMS into acquisition, refinement, storage, retrieval, and dissemination layers, has been empirically validated to demonstrate how well-integrated systems enhance digital collaboration, responsiveness, and innovation.

In spite of these benefits, the successful adoption and utilisation of KMS face multiple challenges that merit detailed examination. These barriers can be categorised broadly into technological, organisational, and human factors. Technological challenges include legacy system integration difficulties and low digital maturity that inhibit interoperability and system scalability.

Organisational barriers encompass resistance to technological change and insufficient alignment between KMS initiatives and strategic objectives. Human factors involve concerns over data privacy and security, as well as inadequate user training and support, which limit system utilisation and knowledge sharing, particularly in highly regulated sectors such as banking and healthcare (Buntak et al., 2020).

This classification of challenges establishes a framework for further critical examination in subsequent sections, enabling a systematic review of socio-technical barriers to KMS implementation. By addressing technological infrastructure limitations, organisational readiness, and human capital competencies, the study aims to illuminate the multifaceted obstacles to effective knowledge management in digitally transforming organisations, such as ABF Sugar Africa.

2.2.1.6 Socio-technical barriers to KM

While advances in KMS have enhanced organisational knowledge processes, empirical research consistently reveals significant socio-technical barriers that hinder KM effectiveness. These barriers encompass three intertwined domains: cultural, technological, and leadership challenges. Cultural barriers include territorial behaviour, mistrust among employees, and fears of job redundancy, all of which serve to discourage open knowledge sharing and collaboration (Martins et al., 2019; Mambo & Smuts, 2022). Technological barriers comprise inadequate ICT infrastructure, poor system integration, and insufficient user training, all of which limit the usability and adoption of KM tools (Erceg & Zoranović, 2020). Leadership barriers involve top-down management approaches, weak change leadership, and a lack of ongoing support, factors that frequently contribute to KM implementation failures even when advanced tools are available (Akhavan et al., 2014; Ardi, 2020).

This socio-technical perspective underscores that technology alone is insufficient to ensure KM success. Rather, an integrated approach is essential, where technological solutions are complemented by robust cultural transformation, proactive leadership engagement, and continuous organisational learning. Addressing these interdependent barriers holistically can

enable more effective knowledge sharing, greater acceptance of KM systems, and sustainable institutionalisation of knowledge practices within organisations undergoing DX.

2.2.2 Digital transformation in organisations

DX represents a fundamental reconfiguration of how organisations operate, compete, and deliver value. It is enabled by emerging technologies such as cloud computing, big data analytics, AI, the IoT, and mobile platforms, but it extends beyond digitisation of processes to include a holistic rethinking of organisational models, leadership paradigms, and value propositions (Vial, 2019). In practice, DX requires organisations to embed digital capabilities across strategy, operations, culture, and people, creating a new environment in which knowledge flows must be managed effectively.

2.2.2.1 Definition and scope of DX

Vial (2019) defines DX as a process through which significant changes to an organisation's properties are triggered by combinations of information, computing, communication, and connectivity technologies. This goes beyond process automation to encompass redesigning customer experiences, reshaping business models, and restructuring internal operations to become more agile and knowledge driven. Kraus et al. (2022) expand this view by showing that DX affects all organisational layers, strategy, people, culture, and technology, emphasising that digital transformation is as much a cultural and leadership shift as it is a technological one. Empirical evidence highlights that successful DX implementation improves customer engagement, operational efficiency, and organisational adaptability, all of which are dependent on effective knowledge mobilisation.

2.2.2.2 Key drivers of DX

A growing body of empirical research points to a constellation of interrelated factors that collectively shape the success of DX. At the forefront is leadership, which consistently emerges as a decisive force in guiding and sustaining transformation efforts. Leaders who possess digital acumen and strategic foresight play a central role in embedding DX into the organisational agenda, influencing not only the adoption of technologies but also the cultural norms that support collaboration and knowledge exchange (Warner & Wäger, 2019; Ardi, 2020). The leadership

imperative extends to crafting a coherent digital vision, fostering data-centric decision-making, and orchestrating the integration of digital systems (Quijada, 2025). Moreover, leadership that actively promotes innovation and team cohesion, particularly in virtual or hybrid settings can accelerate the embedding of digital practices into everyday operations (Sacavém et al., 2025).

Strategic alignment is another essential dimension of DX. Organisations that lack a unified digital strategy often experience disjointed investments and inconsistent technology deployment (Hess et al., 2016). In contrast, those that continuously recalibrate their digital initiatives to remain in sync with evolving business goals are better positioned to realise meaningful transformation outcomes. Jonathan and Watat (2020) argue that strategic alignment is not a fixed endpoint but an ongoing process of harmonising IT capabilities with organisational priorities, enabling improvements in efficiency, innovation, and customer engagement. Agility within the organisation is equally vital. The ability to respond swiftly to external shifts and internal demands is a hallmark of digitally mature enterprises. Agile organisations are characterised by their capacity to reconfigure resources, mobilise cross-functional teams, and experiment with emerging technologies (Teece et al., 2016; Kraus et al., 2022). Zhang et al. (2023) provide evidence that agility is a key determinant of DX performance, shaped by dynamic capabilities such as environmental sensing, opportunity capture, and structural reconfiguration.

Technological infrastructure and digital capabilities form the operational foundation of DX. Platforms such as cloud computing, integrated data systems, and mobile technologies enable automation and support intelligent knowledge flows (Vial, 2019; Leso, 2022). Xiong (2024) highlights the reciprocal relationship between digital maturity and knowledge transfer, showing that robust infrastructures enhance an organisation's ability to manage and apply knowledge effectively, thereby strengthening KM outcomes. Human capital also plays a critical role in enabling transformation. A workforce equipped with digital literacy, adaptability, and the ability to engage with new technologies is essential for sustaining DX initiatives (Kane et al., 2019; Asikhia et al., 2021). The Faster Capital report (2025) underscores the importance of interdisciplinary skill sets, soft skills, and a commitment to lifelong learning. These attributes empower employees to navigate digital disruption and contribute meaningfully to transformation efforts. Taken together, these drivers, leadership, strategic alignment, agility, technology, and

human capital, form a dynamic system that enables DX to support and accelerate KM implementation. Their interaction shapes the organisation's capacity to evolve, respond, and sustain transformation. In synthesising these insights, DX is reframed not simply as a technological upgrade but as a strategic context through which KM becomes embedded as a core organisational capability.

2.2.2.2 Technologies enabling DX

Modern DX is underpinned by an ecosystem of advanced technologies that not only automate but also augment decision-making and enhance knowledge processes. AI facilitates intelligent automation, personalised customer experiences, and predictive analytics. Big data analytics enables real-time insights, performance monitoring, and process optimisation. Cloud Computing provides scalable, on-demand access to computing power and storage, allowing for more flexible KM systems. IoT connects physical devices to digital networks, creating opportunities for data collection, remote monitoring, and operational innovation. According to Buntak et al. (2020), these technologies work synergistically with KM systems by improving data accessibility, collaboration, and knowledge reuse, thereby strengthening organisational learning and performance. For example, AI-powered knowledge engines can automate document tagging, recommend relevant resources, and support decision-making in complex environments.

Technological infrastructure plays a pivotal role in enabling DX, serving not merely as a set of tools but as a strategic foundation upon which organisational change is built. The literature consistently positions technologies such as cloud computing, integrated data systems, mobile platforms, and AI as core enablers of DX, facilitating both operational efficiency and strategic agility (Vial, 2019; Leso, 2022). Cloud computing, in particular, has transformed how organisations deploy and scale digital solutions. Its flexibility and cost-effectiveness allow for rapid experimentation and innovation, while also supporting decentralised work environments and cross-functional collaboration (Vial, 2019). The cloud's ability to host advanced analytics and AI capabilities further enhances its strategic value, enabling data-driven decision-making and real-time responsiveness.

Digital capabilities, however, extend beyond infrastructure. Buntak et al. (2019) argue that successful DX requires a holistic integration of technology into the organisational fabric, including the transformation of processes, structures, and culture. Their study emphasises that digital technologies must be embedded into core business functions and supported by adaptive management practices to unlock their full potential. This view is echoed by Nadkarni and Prügl (2020), who conceptualise DX as a dual process involving both technology-driven change and actor-guided transformation. They identify technology and organisational actors as the two primary dimensions of DX, each influencing how digital tools are adopted, integrated, and leveraged for strategic outcomes. Beyond infrastructure, the development of digital capabilities within the organisation is essential. These capabilities encompass not only the technical systems in place but also the organisational readiness to leverage them effectively. As Leso (2022) notes, digital transformation is most successful when technological investments are aligned with internal competencies, including leadership support, employee digital literacy, and a culture of continuous learning. Without this alignment, technology adoption risks becoming fragmented and ineffective.

The integration of big data analytics and AI has also emerged as a transformative force. These technologies enable organisations to extract insights from vast datasets, personalise services, and optimise decision-making processes (Xiong, 2024). In doing so, they contribute to the development of intelligent systems that support both strategic planning and operational execution. Xiong's empirical findings further suggest that digital capabilities and knowledge transfer are mutually reinforcing, with mature infrastructures enhancing the organisation's ability to capture, disseminate, and apply knowledge effectively. Mobile technologies and integrated data platforms also contribute to DX by supporting real-time communication, remote access, and seamless information flow across departments. These tools facilitate process automation and enhance KM, allowing organisations to respond more dynamically to internal and external changes (Vial, 2019; Xiong, 2024).

Importantly, the literature underscores that technology alone does not drive transformation. Its impact is contingent upon how it is embedded within organisational processes and supported by strategic intent. As Leso (2022) and Xiong (2024) argue, the effectiveness of digital technologies depends on their integration with broader organisational capabilities, including leadership, agility,

and human capital. Technologies such as cloud computing, AI, mobile platforms, and data systems form the backbone of DX, enabling automation, intelligence, and connectivity. Their strategic deployment, when aligned with organisational capabilities, creates the conditions necessary for transformation to take root and evolve. These technologies not only support operational improvements but also serve as catalysts for reconfiguring knowledge flows, enhancing KM, and driving sustained innovation.

2.2.2.3 Challenges to DX

Cultural resistance remains one of the most pervasive barriers to successful transformation. Employees frequently perceive DX as a threat to job security or autonomy, leading to disengagement and passive resistance. Mambo and Smuts (2022) found that change fatigue and fear of automation are particularly pronounced in hierarchical organisations, where psychological safety is limited. Scholkmann (2021) adds that resistance is often systemic, rooted in organisational identity and learning structures. Pal (2025) reinforces this view by showing that even in digitally equipped environments, manual processes persist due to mistrust in new systems. These findings suggest that cultural resistance undermines KM by discouraging knowledge sharing and collaboration. The implication is clear: without cultural readiness, KM systems remain underutilised, reducing their strategic impact and limiting their ability to support innovation and learning.

Technological fragmentation, particularly the persistence of legacy systems, poses another significant challenge. Erceg and Zoranović (2020) highlight that legacy infrastructures often lack interoperability, resulting in siloed data and duplicated efforts. Naqvi et al. (2025) report that outdated programming environments slow innovation and hinder the deployment of cloud and AI solutions. Forbes (2025) estimates that data silos cost businesses trillions annually in lost productivity and revenue. These studies collectively show that fragmented systems prevent seamless knowledge flow across departments, making KM inefficient and disconnected. The “so what” here is that KM thrives on integration, without unified digital infrastructure, organisations cannot capture, disseminate, or apply knowledge effectively, leading to operational inefficiencies and missed opportunities for strategic alignment.

Strategic misalignment is another critical risk factor. DX initiatives often fail when they are driven by technology trends rather than organisational needs. Vial (2019) warns against "technology-push" approaches that prioritise tool adoption over strategic relevance. Jonathan and Watat (2020) argue that strategic alignment between IT capabilities and business objectives is essential for achieving transformation outcomes. Their findings show that organisations with structured digital strategies are more likely to realise improvements in efficiency, innovation, and customer satisfaction. Misalignment results in KM being excluded from strategic planning, reducing its visibility and resource allocation. The implication is that KM must be embedded in the strategic vision of DX; otherwise, it becomes a peripheral activity, disconnected from core business processes and unable to deliver measurable value.

Change management is often underdeveloped in DX programmes, despite its critical role in embedding transformation into organisational routines. Lam et al. (2021) emphasise that leadership training, stakeholder engagement, and iterative rollouts are essential for managing digital transitions. Whatfix (2025) reports that 70% of DX initiatives fail due to poor planning and lack of shared vision. Kotter (2012) reinforces that successful change requires urgency, vision, and reinforcement mechanisms. Weak change management leads to low KM adoption, fragmented usage, and resistance to new knowledge practices. The "so what" is that KM implementation depends on behavioural change; without structured change management, even the most advanced KM systems risk becoming "empty repositories" with low engagement and limited impact.

Human capital readiness is a decisive factor in DX success. Kane et al. (2019) and Asikhia et al. (2021) show that digital literacy and adaptability are essential for engaging with emerging systems. Shatilaa et al. (2025) found that digital literacy and accessibility enhance innovation and resilience, while Raihan et al. (2024) highlight that digital inequity, stemming from lack of access and training, limits participation in DX. These findings underscore that KM effectiveness depends on inclusive digital strategies and continuous upskilling. The implication is that KM is only as effective as its users; investing in digital skills ensures that KM systems are accessible, relevant, and embedded in organisational routines.

These challenges are not standalone issues but interdependent constraints that shape the success or failure of DX and KM. Cultural resistance can exacerbate strategic misalignment; legacy systems can undermine change management; and digital literacy gaps can limit the effectiveness of even well-aligned strategies. For KM implementation to succeed in a DX environment, organisations must address these challenges holistically aligning leadership, infrastructure, strategy, and people. This study positions these challenges as critical DX constructs that influence KM outcomes. By empirically examining their impact at ABF Sugar Africa, the research aims to identify which barriers are most significant and how they can be mitigated. The findings will inform a predictive model that guides organisations in aligning digital strategies with KM practices to achieve sustainable transformation.

2.2.2.4 The role of DX in facilitating KM

Empirical evidence affirms that DX enhances KM through multiple pathways. Xiong (2024) demonstrates that knowledge transfer significantly improves when supported by digital infrastructure and dynamic capabilities such as sensing, seizing, and reconfiguring. These capabilities allow organisations to capture and apply knowledge in real time, thereby enhancing responsiveness and strategic agility. The study's structural equation modelling confirms that DX constructs not only facilitate KM but also mediate its effectiveness through organisational learning and innovation. Petana and Rosa (2020) further argue that DX enables KM by automating business processes and embedding decision-support systems that convert raw data into actionable insights. Their proposed MATSKI framework illustrates how microservices and agile teams, hallmarks of DX, support the transformation of data into embedded knowledge, thereby enhancing competitiveness and operational efficiency. This finding is particularly relevant for organisations seeking to align KM with digital business models and customer-centric strategies.

Thomas (2024), using a STS lens, identifies four critical dimensions, motivation, technology, people interaction, and organisational structure as key DX drivers that shape KM outcomes. These dimensions correspond to the DX constructs operationalised in this study and reinforce the argument that KM cannot thrive in isolation. Instead, it requires a digitally enabled environment that supports collaboration, openness, and continuous learning. In the African context, Mannie et al. (2013) validate that organisational culture and learning orientation are significant enablers of

KM in South African government agencies. Their findings, derived from structural equation modelling, highlight that DX must be accompanied by cultural transformation and leadership commitment to foster knowledge sharing. Similarly, Dayal (2023) explores KM practices in the South African public sector post-COVID-19, revealing that digital infrastructure, policy alignment, and cross-sectoral collaboration are essential for KM to support evidence-based policymaking and service delivery.

Despite these insights, several gaps persist in the literature. First, most empirical studies are concentrated in developed economies, with limited validation in African organisational contexts. This restricts the transferability of existing DX–KM models and overlooks region-specific constraints such as infrastructure limitations, digital literacy disparities, and cultural dynamics. Second, while technology is frequently cited as a driver of KM, human-centred DX constructs such as change readiness, and strategic alignment are often underexplored. This omission limits the explanatory power of current models and fails to capture the full spectrum of factors influencing KM success. Third, there is a lack of integrated measurement frameworks that quantify the influence of DX constructs on KM outcomes. Existing studies tend to focus on isolated variables, such as IT infrastructure or leadership style, without examining how these interact to shape KM implementation. This fragmentation hinders the development of predictive models and reduces the practical utility of research findings for organisations seeking to align digital strategies with knowledge practices.

In response to these gaps, this study conceptualises DX as the dominant enabler of KM, exerting influence through three primary mechanisms that is technological acceleration, platforms such as cloud computing, AI, and big data analytics enhance the speed, accessibility, and contextual relevance of knowledge, enabling KM systems to operate in real time and at scale. Cultural transformation, digital-first cultures foster openness, trust, and psychological safety, which are prerequisites for effective knowledge sharing and collaboration. Strategic alignment, DX leadership integrates KM into organisational vision, resource allocation, and performance metrics, ensuring that knowledge practices are not peripheral but central to strategic execution.

2.2.3 Influence of DX on KM

DX has emerged as one of the most critical forces shaping how organisations design, manage, and optimise their KM practices. Far from being a purely technological shift, DX represents a deep organisational change that reconfigures structures, strategies, culture, and processes in ways that directly affect how knowledge is generated, captured, shared, and applied (Vial, 2019; Kraus et al., 2022). Empirical research increasingly demonstrates that the success of KM in modern organisations is largely dependent on how DX initiatives are conceived and implemented, highlighting the reciprocal but directional influence of digital technologies on KM outcomes (Ribeiro et al., 2022; Savickas, 2024).

2.2.3.1 Redefining the scope of KM through DX

DX broadens the scope and ambition of KM. Traditionally, KM focused on codifying explicit knowledge and supporting limited knowledge-sharing mechanisms. However, the adoption of advanced digital technologies has transformed KM into a more dynamic, integrated, and strategic process. Digitalisation enables knowledge to be embedded into workflows, connected across organisational silos, and made accessible in real time. As Kraus et al. (2022) argue, DX reshapes KM by shifting it from static knowledge repositories to interactive, intelligent, and adaptive systems that evolve with organisational needs.

2.2.3.2 Digital technologies as enablers of KM

Empirical studies confirm that technologies such as cloud computing, AI, big data analytics, and collaborative platforms each contribute distinct capabilities that enhance KM outcomes. For instance, cloud infrastructure supports decentralised access to knowledge repositories, enabling geographically dispersed teams to collaborate in real time and reduce latency in decision-making. Igbinovia and Ikenwe (2018) found that cloud-based KM systems improve document control and reduce duplication, while Vial (2019) and Leso (2022) emphasised their role in facilitating scalable knowledge flows across organisational boundaries. AI technologies further strengthen KM by automating the classification, retrieval, and contextual delivery of knowledge assets. Ly (2023) and Alavi & Leidner (2001) demonstrated that AI-enabled KM systems improve decision speed and accuracy by surfacing relevant insights at the point of need and enhancing reuse rates. Big data analytics contribute by transforming large volumes of structured and unstructured data into

actionable insights, enriching KM repositories and supporting strategic foresight. Erceg & Zoranović (2020) and Ribeiro et al. (2022) showed that analytics-driven KM systems enhance responsiveness and innovation by enabling predictive decision-making.

Collaborative platforms such as Microsoft Teams and Slack facilitate tacit knowledge exchange through digital dialogue and mentoring, preserving experiential insights that are often lost in traditional systems. Torabi & El-Den (2017) and Mohajan (2017) confirmed that these platforms foster cross-functional collaboration and support informal knowledge sharing, which is critical for organisational learning. Collectively, these technologies enable five core KM transformations: real-time access to knowledge, intelligent search and retrieval, cross-functional collaboration, predictive analytics for decision support, and integration of tacit and explicit knowledge. These transformations align with the SECI model of knowledge creation (Nonaka & Takeuchi, 1995), reinforcing the argument that KM effectiveness is contingent upon the maturity and integration of digital technologies. The strategic implication is clear, without alignment to leadership vision, cultural readiness, and change management, these technologies risk becoming underutilised, limiting KM's ability to support innovation, agility, and evidence-based decision-making. This reinforces the study's conceptualisation of DX as the dominant enabler of KM, where technology functions as a lever for embedding knowledge into core organisational processes and sustaining competitive advantage.

2.2.3.3 Challenges in implementing KM Under DX

The implementation of Knowledge Management (KM) within digitally transforming organisations is often constrained by a set of interdependent challenges that extend beyond technological limitations. These challenges are deeply embedded in organisational culture, infrastructure, leadership, and human capability, and they directly influence the success or failure of KM initiatives. One of the most persistent barriers is cultural resistance, particularly in environments where hierarchical structures and compliance-driven mindsets dominate. Mambo and Smuts (2022) found that in such contexts, employees often perceive digital transformation as a threat to autonomy or job security, leading to disengagement and reluctance to share knowledge. This resistance is not merely behavioural, it reflects systemic issues in organisational identity and learning structures (Scholkmann, 2021). Even in digitally equipped environments, manual

processes persist due to mistrust in new systems (Pal, 2025), which undermines KM by discouraging openness and collaboration. Without a culture of psychological safety and trust, KM systems remain underutilised, reducing their strategic impact.

A second challenge is technological fragmentation, particularly the persistence of legacy systems that lack interoperability. Erceg and Zoranović (2020) highlight that siloed infrastructures prevent seamless knowledge flows, resulting in duplicated efforts and inefficiencies. Naqvi et al. (2025) report that outdated programming environments slow innovation and hinder the deployment of cloud and AI solutions. Forbes (2025) estimates that data silos cost businesses trillions annually in lost productivity and revenue. These findings underscore that KM thrives on integration; without unified digital infrastructure, organisations cannot capture, disseminate, or apply knowledge effectively. Strategic misalignment further complicates KM implementation. Vial (2019) warns against "*technology-push*" approaches that prioritise tool adoption over strategic relevance. Jonathan and Watat (2020) argue that strategic alignment between IT capabilities and business objectives is essential for achieving transformation outcomes. When KM is excluded from strategic planning, it becomes a peripheral activity, disconnected from core business processes and unable to deliver measurable value. This limits KM's visibility, resource allocation, and its ability to support innovation and decision-making.

Another critical barrier is underdeveloped change management. Lam et al. (2021) emphasise that leadership training, stakeholder engagement, and iterative rollouts are essential for embedding digital transitions. Whatfix (2025) reports that 70% of DX initiatives fail due to poor planning and lack of shared vision. Kotter (2012) reinforces that successful change requires urgency, vision, and reinforcement mechanisms. Weak change management leads to low KM adoption, fragmented usage, and resistance to new knowledge practices. KM implementation depends on behavioural change; without structured change governance, even the most advanced KM systems risk becoming "empty repositories" with low engagement and limited impact. Human capital readiness is a decisive factor. Kane et al. (2019) and Asikhia et al. (2021) show that digital literacy and adaptability are essential for engaging with emerging systems. Shatilaa et al. (2025) found that digital literacy and accessibility enhance innovation and resilience, while Raihan et al. (2024) highlight that digital inequity, stemming from lack of access and training, limits participation in

DX. KM is only as effective as its users; investing in digital skills ensures that KM systems are accessible, relevant, and embedded in organisational routines.

These challenges are not standalone, they interact and compound. Cultural resistance can exacerbate strategic misalignment; legacy systems can undermine change management; and digital literacy gaps can limit the effectiveness of even well-aligned strategies. For KM implementation to succeed in a DX environment, organisations must address these challenges holistically aligning leadership, infrastructure, strategy, and people. This study positions these challenges as critical DX constructs that influence KM outcomes. In empirically examining their impact at ABF Sugar Africa, this study aims to identify which barriers are most significant and how they can be mitigated through targeted interventions.

2.3 Critical success factors for DX - KM implementation

DX creates the organisational environment within which KM is implemented and sustained. The extent to which DX improves KM depends on how seven DX constructs, experiences, people, change, innovation, leadership, technology, and culture, are enacted and integrated. These constructs operate as environmental levers that influence the four KM pillars of leadership, organisation, technology, and learning as illustrated on Table 2.1 (Alavi & Leidner, 2001; Prasad & Junni, 2017).

Table 2. 1: DX–KM success factors with detailed empirical gap analysis

DX construct	**KM construct influenced**	**Empirical evidence**	**Context of evidence**	**Empirical gap description**
Experiences (CX/EX)	KM Organisation, Technology, Learning	Lemon & Verhoef (2016); Chew & Gottschalk (2013); Argote (2013); Mannie et al. (2013)	USA, Europe, South Africa	CX/EX are acknowledged as valuable knowledge sources, but few studies empirically test how experience data is codified and reused in KM systems. African validations are limited and fragmented.
People (Skills, roles, incentives)	KM Organisation & Leadership	Kane et al. (2019); Hislop et al. (2018); North & Kumta (2018);	USA, UK, Global South	Human capital factors are conceptually strong but lack consistent operationalisation. Incentives and role clarity are

DX construct	KM construct influenced	Empirical evidence	Context of evidence	Empirical gap description
		Shatilaa et al. (2025)		underexplored in KM adoption models, especially in African enterprises.
Change Management	KM Organisation & Learning	Kotter (2012); Hiatt (2006); Lam et al. (2021); Ponce Pulido & Taherdoost (2024)	USA, Europe, MENA	Change is often discussed theoretically but rarely tested as a mediator in DX–KM models. Few studies quantify its impact on KM adoption and sustainability in African contexts.
Innovation	KM Learning	Teece (2018); Papa et al. (2018); Nonaka & von Krogh (2009)	USA, Europe	Innovation is treated as a KM output rather than a driver. Empirical studies lack analysis of how innovation processes feed KM repositories. African innovation ecosystems are underrepresented.
Leadership	KM Leadership	Cortellazzo et al. (2019); Sacavém et al. (2025); Nonaka et al. (2006)	Europe, Global	Leadership is widely cited as a KM enabler, but most evidence is qualitative. Few studies use statistical models to test leadership's predictive power on KM success in African organisations.
Technology	KM Technology	Alavi & Leidner (2001); Ly (2023); Leso (2022); Erceg & Zoranović (2020)	USA, Asia, Europe	Studies focus on infrastructure and digital maturity but overlook interoperability and usability. Limited empirical evidence exists on how fragmented systems affect KM performance in African firms.
Culture	KM Organisation & Learning	Schein (2017); Edmondson (2019); Mambo & Smuts (2022)	Global, South Africa	Cultural readiness is acknowledged but rarely measured. Few validated instruments exist to assess

				openness, trust, and psychological safety in KM contexts, especially in African settings.

2.3.1 Experiences (customer and employee)

In the context of DX, customer experience (CX) and employee experience (EX) serve as crucial touchpoints that shape KM effectiveness. CX reflects how customers perceive and interact with digital products and services, while EX captures how employees engage with digital tools, processes, and organisational culture (Lemon & Verhoef, 2016; Kane et al., 2019). Together, these experiences generate problem–solution contexts that make knowledge both relevant and reusable. A central aspect of DX is the continuous capture of experience signals such as voice-of-customer data, service telemetry, user journeys, and employee feedback loops which provide high-value inputs for knowledge creation and codification (Kiron et al., 2016). For example, customer complaints can be transformed into structured lessons learned, FAQs, or service playbooks, while employee feedback about tool usability or process gaps can inform workflow adjustments. These insights, when integrated into KM flows, help organisations not only resolve recurring issues but also anticipate emerging needs.

From a KM perspective, experiences act as knowledge triggers that feed into the four KM pillars. Organisation, experience analytics inform taxonomy design, classification of knowledge objects, and prioritisation of updates. Technology, CX/EX signals enable the updating of digital knowledge repositories, service playbooks, and search features. Learning, lessons learned from experience data become valuable training content and inputs for capability-building programs. Leadership, executive review and sponsorship of CX/EX insights legitimise KM outputs as strategic decision assets, ensuring they are embedded into governance processes. Research further shows that organisations that systemically connect experience management with KM processes achieve greater reuse rates of knowledge, shorter time-to-resolution, and stronger alignment between knowledge flows and business value (Chew & Gottschalk, 2013). This aligns with the argument that experiences, when properly codified, help bridge the tacit–explicit knowledge gap, as

individual encounters are transformed into collective organisational assets (Nonaka & Takeuchi, 1995). In practice, the implications of integrating CX and EX into KM systems extend beyond efficiency, they also foster trust and relevance. Employees are more likely to contribute knowledge if they see their feedback embedded in formal repositories, while customers benefit from improved self-service journeys and quicker resolution of queries. This dual reinforcement strengthens KM as both an operational enabler and a strategic resource in DX environments.

In the evolving landscape of DX, CX and EX have emerged as strategic levers for enhancing KM effectiveness. CX encompasses the perceptions and interactions customers have with digital products and services, while EX reflects how employees engage with digital tools, processes, and organisational culture (Lemon & Verhoef, 2016; Kane et al., 2019). These experiences are not merely operational touchpoints, they are dynamic sources of insight that generate problem–solution contexts, making knowledge both relevant and reusable. The continuous capture of experience signals, such as voice-of-customer data, service telemetry, user journeys, and employee feedback loops, provides high-value inputs for knowledge creation and codification (Kiron et al., 2016). For instance, customer complaints can be transformed into structured lessons learned, FAQs, or service playbooks, while employee feedback on tool usability or process inefficiencies can inform workflow redesign. When these insights are systematically integrated into KM flows, organisations can resolve recurring issues more effectively and anticipate emerging needs with greater agility.

From a KM perspective, experiences act as knowledge triggers that feed into the four foundational pillars of KM, organisation, technology, learning, and leadership. Experience analytics inform taxonomy design and the classification of knowledge objects, ensuring that repositories remain relevant and accessible. CX and EX data also drive updates to digital knowledge bases, service playbooks, and search functionalities, enhancing the technological infrastructure of KM. Lessons learned from experience data become valuable content for training programs and capability-building initiatives, reinforcing organisational learning. Moreover, when executives review and sponsor CX/EX insights, KM outputs gain legitimacy as strategic assets, embedding them into governance and decision-making processes.

Empirical research supports the strategic integration of CX and EX into KM systems. Lemon and Verhoef (2016) emphasize that CX is shaped across multiple touchpoints, necessitating cross-functional knowledge integration to deliver consistent and personalized service. Chew and Gottschalk (2013) demonstrate that IT-enabled knowledge sharing enhances service innovation by embedding customer insights into organisational routines. Argote (2013) shows that organisational experience, when systematically retained and reused, improves KM outcomes and decision-making. Malik et al. (2023) provide robust evidence that AI-mediated knowledge-sharing platforms enhance both CX and EX by enabling real-time collaboration, feedback integration, and personalized service delivery. In the South African context, Mannie et al. (2013) found that integrating employee feedback and service delivery experiences into KM systems improved responsiveness and policy alignment in public sector agencies.

Though these advances, several limitations persist. CX and EX are often treated in isolation, with few empirical models examining their interconnected influence on KM outcomes. Digital platforms, while effective in capturing experience data, tend to overemphasize technological mediation and underexplore behavioural and cultural dimensions such as employee autonomy, ethical considerations, and experiential context (Kane et al., 2019). Additionally, most studies are cross-sectional and concentrated in developed economies, with limited validation in African contexts. Mannie et al. (2013) observed that in South African public sector agencies, experience data was inconsistently captured and poorly integrated into KM systems, undermining its strategic value. Furthermore, CX is inherently multi-dimensional and dynamic, making it difficult to measure consistently across channels and touchpoints, which complicates its integration into KM frameworks. Argote (2013) also notes that while organisations may capture experience, they often fail to reuse it effectively due to organisational forgetting, lack of codification, and weak transfer mechanisms.

These findings underscore the need to treat CX and EX as dynamic, codifiable knowledge assets within KM systems. By addressing the gaps through integrated, context-sensitive models, particularly in African enterprises, organisations can enhance the relevance, responsiveness, and strategic alignment of KM under DX conditions. Such an approach not only improves operational

efficiency but also fosters trust, engagement, and long-term value creation across both customer and employee domains.

2.3.2 People (skills, roles, incentives)

People are central to the success of both DX and KM), as their skills, roles, and motivations directly shape how knowledge is created, shared, and applied. In digitally transforming organisations, success depends not only on the deployment of technology but on the human capabilities that enable its effective use. Digital fluency, the ability to confidently engage with digital tools and platforms, is increasingly recognised as a prerequisite for KM participation. However, digital fluency alone is insufficient, employees must also possess knowledge fluency, which refers to the ability to contribute, curate, and apply knowledge meaningfully across organisational contexts (Cain & Coldwell-Neilson, 2024).

Empirical studies consistently highlight the importance of role clarity in KM implementation. The designation of knowledge stewards, community managers, and content curators ensures that KM responsibilities are institutionalised rather than informal or ad hoc. These roles support structured knowledge flows and reinforce accountability, enabling KM systems to function as strategic assets rather than passive repositories (Onofre & Teixeira, 2021). Without clearly defined roles, KM initiatives often suffer from fragmentation, inconsistent participation, and low reuse of knowledge assets. Incentive structures are another critical enabler. Recognition programmes, performance-linked rewards, and peer validation mechanisms have been shown to increase employee engagement with KM platforms. However, many organisations fail to embed incentives into formal performance systems, treating KM participation as voluntary or peripheral. This undermines the strategic value of KM and contributes to low adoption rates (Ghomi & Barzinpour, 2018). Moreover, psychological safety, the belief that individuals can share insights without fear of criticism or reprisal, is essential for fostering a culture of openness and collaboration (Edmondson, 2019).

Though the theoretical consensus, several limitations persist in literature. First, human factors such as digital fluency, role clarity, and incentives are often discussed conceptually but rarely operationalised in empirical KM models. Studies lack validated instruments to measure their direct

impact on KM outcomes (Caton, 2024). Second, most research is concentrated in Western or corporate contexts, with limited validation in African enterprises. For example, Mannie et al. (2013) found that in South African government agencies, KM roles were poorly defined and incentives misaligned, leading to low engagement and inconsistent knowledge sharing. Third, KM initiatives often overlook behavioural enablers such as trust, autonomy, and cultural norms, which mediate the relationship between people and KM effectiveness (APQC, 2025). From a KM implementation perspective, people-related factors influence all four KM pillars:

- Organisation - defined ownership of knowledge domains ensures that taxonomies, content standards, and repositories remain current and reliable.
- Leadership - establishing contribution norms and aligning incentives with strategic goals embeds KM into daily workflows.
- Learning - continuous enablement through academies, microlearning, and digital skills programmes ensures that employees are equipped to contribute effectively.
- Technology - end-user proficiency enables staff to maximise the value of KM platforms through effective search, tagging, and curation.

To address these limitations, future KM strategies must integrate human capital development into digital transformation planning. This includes formalising KM roles, embedding incentives into performance systems, and cultivating a psychologically safe environment for knowledge sharing. In African contexts, KM frameworks must be adapted to reflect local cultural dynamics, resource constraints, and organisational structures to ensure relevance and sustainability (Chidiadi, 2024).

2.3.3 Change (governance and adoption)

DX is inherently change-intensive, requiring organisations to continuously adapt structures, processes, and behaviours to fully leverage digital opportunities. In this context, change management becomes a critical success factor for ensuring that digital initiatives are not only implemented but also adopted, institutionalised, and translated into sustained KM practices (Kotter, 2012; Burnes, 2017). Effective DX-driven KM requires an approach that integrates governance, adoption mechanisms, and adaptive learning loops. Governance ensures that KM-related initiatives are prioritised, resourced, and aligned with organisational strategy. Adoption mechanisms focus on building acceptance and embedding KM into everyday work practices, while

adaptive learning loops provide feedback that enables continuous refinement (Armenakis & Harris, 2009).

Empirical studies support this view. Lam et al. (2021), in a study of European digital firms, found that structured change governance, through steering committees and executive dashboards, significantly improved KM adoption rates. Ponce Pulido & Taherdoost (2024), examining DX in MENA-region enterprises, showed that change readiness and stakeholder engagement were key predictors of KM sustainability. In the South African public sector, Mannie et al. (2013) found that lack of formal change management frameworks led to fragmented KM practices and poor reuse of knowledge assets. From a KM perspective, change influences all four KM pillars:

- Leadership - governance mechanisms such as sponsorship models and executive dashboards ensure KM adoption remains a leadership priority.
- Organisation - structured content lifecycle workflows (creation, review, archiving) reduce resistance to outdated or irrelevant assets.
- Technology - telemetry-driven improvement loops provide real-time data on usage, search success, and gaps, enabling iterative improvements.
- Learning - reskilling and behavioural enablement through training, communities of practice, and change readiness programmes equip staff to adapt their knowledge behaviours.

Regardless of growing recognition of change as a KM enabler, several empirical gaps persist. First, most studies on change management and KM are qualitative or case-based, with few offering statistically validated models that test change as a mediator or predictor of KM outcomes (Lam et al., 2021; Ponce Pulido & Taherdoost, 2024). Second, change readiness, governance structures, and adoption mechanisms are often described conceptually but lack standardised scales for empirical testing, limiting comparability and generalisability across contexts. Third, behavioural dimensions such as psychological safety, trust, and cultural norms, which are critical for adoption, are rarely explored in relation to KM effectiveness. Fourth, most empirical work is concentrated in Europe, North America, and Asia, with minimal validation in African organisations. Studies such as Mannie et al. (2013) and Dayal (2023) highlight that African enterprises face unique constraints, including resource limitations, hierarchical structures, and regulatory complexity, which are not reflected in existing models. Change is often treated as a one-time event rather than

a continuous process, limiting understanding of how iterative mechanisms like telemetry feedback and agile rollouts sustain KM over time.

These gaps reinforce the need for context-sensitive, empirically validated models that treat change as a dynamic, multi-dimensional construct. This study addresses these limitations by operationalising change through governance, adoption, and behavioural enablement, and testing its influence on KM implementation using quantitative techniques within an African enterprise context.

2.3.4 Innovation (experimentation and learning)

DX thrives on innovation, experimentation, and organisational ambidexterity, the ability to simultaneously exploit existing capabilities while exploring new ones (Teece, 2018; O'Reilly & Tushman, 2013). Innovation pipelines, covering ideation, piloting, and scaling, produce valuable experiential knowledge. However, this knowledge only creates sustained organisational value when it is captured, codified, and integrated into KM systems. Embedding learning reviews, structured post-mortems, and "fail-fast" documentation ensures that lessons are not lost in isolated projects but contribute to the organisation's collective intelligence (Nonaka & von Krogh, 2009). Similarly, innovation tagging, search facets, and categorisation in repositories enable findability and reuse of tested solutions. Leadership reinforcement, such as rewarding reuse over reinvention, is critical to shifting behaviours from isolated innovation toward cumulative knowledge building. Implications for KM, Learning to Organisation like innovation reviews feeding repositories. Technology such as innovation tags and search features for knowledge retrieval. Leadership such as sponsorship and recognition systems rewarding reuse.

2.3.5 Leadership (vision, sponsorship, accountability)

Leadership remains the most critical lever for DX-driven KM implementation. Digital leaders establish a compelling knowledge-centric vision, allocate resources, and create accountability mechanisms for KM adoption (Westerman et al., 2014; Kane et al., 2019). Without leadership sponsorship, KM risks being sidelined as an optional support function rather than a strategic enabler. Leaders influence KM outcomes by establishing governance forums, articulating incentives aligned to knowledge outcomes, and investing in AI-enabled platforms that improve

accessibility and personalisation. Their visible engagement in learning rituals for example, knowledge-sharing townhalls, cross-functional reviews, legitimises KM as an organisational priority (Zheng et al., 2010). Implications for KM, in leadership governance structures and sponsorship. In organisation: Incentive alignment to knowledge-sharing outcomes. Technology investment in AI, analytics, and search platforms and learning active executive involvement in knowledge rituals.

2.3.6 Technology (platforms, data, interoperability)

DX modernises the digital stack through cloud, big data platforms, AI, and collaboration tools, which directly enhance KM capability (Ly, 2023). Advanced technologies improve findability, integration, and personalisation of knowledge. For example, AI-driven recommendations surface relevant content at the point of need, while interoperability across platforms prevents duplication and knowledge silos (Alavi & Leidner, 2001). The effectiveness of KM depends not only on technology availability but also on data governance, interoperability, and usability. Integrated content lifecycle management ensures freshness and reduces redundancy, while analytics track gaps and measure relevance. These functions elevate KM from a static repository to a dynamic decision-support ecosystem. Implications for KM, organisation, integrated content lifecycle workflows. Leadership to Technology, governance of data and interoperability and technology relevance analytics, AI-driven recommendations, seamless search.

2.3.7 Culture (openness, trust, psychological safety)

Culture is the invisible enabler of both DX and KM. A digital-first, knowledge-sharing culture encourages employees to convert tacit knowledge into explicit assets (Nonaka & Takeuchi, 1995; Schein & Schein, 2017). Critical cultural elements include openness, collaboration norms, and psychological safety, the belief that individuals can share insights or admit mistakes without fear of retribution (Edmondson, 2019). Such a culture transforms KM from a compliance activity into a voluntary, value-creating practice. Rituals like after-action reviews, peer recognition, and cross-functional communities foster ongoing contribution. Leaders play a key role by modelling transparency and learning behaviour, setting norms that reinforce collaboration across silos. Implications for KM on organisation is knowledge-sharing rituals and communities, and on leadership is modelling openness and transparency. Technology is social features and recognition embedded in platforms.

2.4 Empirical gaps and research opportunity

Regardless of the growing scholarly and practitioner interest in the DX to KM nexus, the current body of literature reveals several persistent gaps that limit both theoretical development and practical application. These gaps highlight the need for empirical, context-sensitive models that explicitly test how DX constructs influence KM implementation outcomes.

2.4.1 Quantitative measurement gaps

While numerous studies acknowledge the synergies between DX and KM, most rely on conceptual or qualitative approaches that describe relationships rather than test them quantitatively. Several studies exemplify this limitation. Bouthillier and Shearer (2002), in their comprehensive examination of KM practices across various organisations in North America and Europe, relied primarily on case studies and qualitative descriptions rather than statistical validation. Similarly, Lin's (2007) stage model of KM evolution in Taiwanese organisations, whilst employing quantitative data from 141 senior executives, focused on KM process maturity rather than testing specific DX constructs' predictive power on KM outcomes.

The Greek study by Theriou et al. (2011), investigating KM enabler factors across 113 medium and large manufacturing firms, demonstrated significant quantitative findings, showing that leadership ($\beta=0.34$, $t=2.52$) and culture ($\beta=0.39$, $t=2.96$) significantly predicted KM effectiveness, whilst technology ($\beta=0.03$, $t=0.21$) and strategy ($\beta=0.09$, $t=0.59$) showed no significant relationships. However, this study was limited to traditional KM enablers without incorporating contemporary DX constructs such as customer/employee experiences, innovation pipelines, or change management capabilities. Moreover, quantitative analyses estimating effect sizes of specific DX constructs, such as leadership, technology, or culture on KM outcomes remain scarce, particularly in developing economy contexts.

2.4.2 Human-centred factor under-operationalisation

Research has tended to emphasise technology at the expense of CX/EX and workforce capability. The European Conference on Knowledge Management (2024) highlighted that whilst AI-powered tools enhance KM systems, "people should remain central to all KM initiatives". Yet, DX

outcomes are highly dependent on human-centred factors such as digital fluency, role clarity, and incentives for knowledge contribution. Kane et al. (2019), in their global survey of 4,394 executives across various industries in the United States and Europe, found that digital fluency and workforce capability were critical success factors, but limited operationalisation of these variables in KM models restricts understanding of how human capital and lived experiences shape knowledge reuse, decision quality, and innovation.

2.4.3 System integration blind spots

A third gap involves interoperability and integration across digital systems. Gaglio's (2022) quantitative study of 432 South African firms examining digital communication technologies' effects on innovation and productivity found that fragmented systems hindered knowledge flows. Similarly, research by Zuma et al. (2023) on Enterprise Resource Planning implementation in six South African organisations revealed that "effective change management and knowledge strategies" were essential, yet most studies examine KM or DX tools in isolation without addressing how seamless integration of platforms, taxonomies, and governance mechanisms impacts KM performance. This leaves organisations without evidence-based guidance on designing interoperable ecosystems that reduce silos and increase knowledge findability.

2.4.4 Geographic and contextual gaps

Much of the empirical research on DX and KM is Western-centric, focusing on advanced economies with mature infrastructures. Examining specific studies confirms this pattern: Theriou et al. (2011) focused on Greek manufacturing firms, Lin (2007) studied Taiwanese organisations, and European research dominates recent KM literature. African contexts, in contrast, face unique constraints related to infrastructure, skills, regulation, and cultural dynamics. Specific African studies reveal these contextual limitations. Barbier and Tengeh's (2023) mixed-methods study of 139 South African government officials found that "officials charged with KM implementation lack the necessary implementation skillset" and identified "extreme silos in working towards a common objective". The study revealed critical gaps: lack of management understanding of KM, limited capacity, and officials not feeling the need to participate in KM initiatives. Similarly, Nenungwi's (2022) study of KwaZulu-Natal Department of Public Works found that whilst 75% of 61 respondents acknowledged a KM strategy existed, 43% indicated knowledge records were

not readily accessible, and 31% were unaware of mechanisms to transform tacit to explicit knowledge.

The Local Government Skills Development Authority's (2023) research report on KM in South African local government concluded that "very little empirical research" exists on KM in African contexts, with "several capacity challenges concentrated on ten problems" including financial resources, human resources, and infrastructure limitations. As Boateng (2021) notes, there is a scarcity of context-sensitive KM models in emerging markets, which reduces the transferability and relevance of existing frameworks to Global South organisations. These limitations become even more pronounced when knowledge management is examined within the context of ongoing digital transformation initiatives in South Africa.

While global literature positions digital transformation (DX) as a key enabler of knowledge management (KM), South African organisations operate within a distinct socio technical context that shapes how DX translates into KM outcomes. This context is characterised by infrastructure inequality, digital access disparities, skills shortages, and entrenched organisational and cultural legacies. Empirical evidence shows that uneven digital infrastructure and connectivity, particularly between urban and rural areas, continue to constrain reliable KM system deployment and real time knowledge sharing (Stats SA, 2023). In addition, high data costs and unequal access to digital tools limit inclusive participation in KM practices, reinforcing organisational knowledge silos despite investments in DX platforms (DCDT, 2023).

Human capital readiness further mediates the DX KM relationship. Local studies demonstrate that limited digital fluency, weak KM competencies, and insufficient training hinder effective KM implementation, even where formal strategies exist (Mannie et al., 2013; Nenungwi, 2022). Organisational culture compounds these challenges, as hierarchical governance structures and compliance oriented norms often inhibit open knowledge sharing and psychological safety (Mambo & Smuts, 2022). From a broader emerging economy perspective, KM models developed in advanced economies are frequently insufficiently contextualised for African settings, where resource constraints and institutional complexity significantly influence knowledge flows (Boateng, 2021). Collectively, these South African specific socio technical constraints highlight

the need for contextually grounded empirical research, which this study addresses by examining the influence of DX constructs on KM implementation within ABF Sugar Africa.

2.4.5 Strategic outcome measurement limitations

Most studies equate KM success with adoption and usage metrics, for example, number of active users, frequency of content contribution. The UKZN study by Mannie et al. (2013) on African Higher Education found that KM was "primarily used in strategy formulation at operational and support areas" rather than core academic functions, with "lack of sophisticated and powerful KM Information Systems" limiting strategic impact. Similarly, Phaladi's (2024) study of South African public enterprises revealed that "organisational tacit knowledge loss is largely caused by voluntary and involuntary employee turnover," yet failed to link KM effectiveness to strategic organisational outcomes such as decision speed, innovation throughput, or cost-to-serve improvements. While important, these measures neglect links to strategic organisational outcomes, such as decision speed and quality, innovation throughput, risk mitigation, or cost-to-serve improvements. Without such outcome-level measurement, the strategic contribution of KM to digital business models remains under-theorised and under-validated.

2.4.6 Research opportunity and study contribution

To address these identified gaps this study will operationalise DX constructs quantitatively, employ validated measurement scales for the seven DX constructs (experiences, people, change, innovation, leadership, technology, and culture), addressing the quantitative measurement gap identified in existing literature. Map DX-KM relationships empirically by positioning the four KM pillars (leadership, organisation, technology, and learning) as dependent variables and apply Partial Least Squares Structural Equation Modelling (PLS-SEM) to test the magnitude, direction, and statistical significance of DX-KM pathways, building on methodological approaches used in Greek and Taiwanese contexts but extending to African organisational settings. Explore complex relationships, examine mediation and moderation effects, such as whether change mediates leadership's influence on KM adoption, or culture moderates technology's effect on KM effectiveness, addressing the system integration blind spots identified in current literature. Provide African contextual validation, by conducting the study within ABF Sugar Africa's five-country operations, thereby contributing empirical evidence from the Global South and enhancing the

contextual relevance of DX–KM models, directly addressing the geographic gap identified in existing research. Link to strategic outcomes by measuring KM effectiveness through strategic organisational outcomes rather than merely adoption metrics, addressing the strategic outcome measurement limitations found in current African studies.

The expected outcome is a validated DX-KM model that identifies which DX environmental factors serve as critical success factors for KM implementation. This contributes theoretically by closing the measurement and contextual gaps identified in the literature, and practically by providing managers with evidence-based guidance on designing knowledge-centric digital transformation strategies. In addressing these specific empirical gaps through quantitative validation in an African multinational context, this study advances both academic understanding and practical implementation of DX-KM integration in emerging market economies.

2.5 Theoretical literature review

2.5.1 Knowledge management theories

Understanding how DX constructs influence KM constructs requires grounding in well-established theories that explain how organisations generate, mobilise, and sustain knowledge within evolving digital environments. This review focuses on four theoretical domains, knowledge creation, resource advantage, organisational adaptability, and innovation adoption, which together provide the conceptual scaffolding for analysing the DX–KM nexus.

2.5.1.1 Knowledge creation and the SECI model

Nonaka and Takeuchi's (1995) SECI Model is one of the most influential frameworks in knowledge management, conceptualising knowledge creation as a dynamic and continuous process. It emphasises the interaction between tacit knowledge (personal, experiential, context-specific, and hard to formalise) and explicit knowledge (formalised, documented, and transferable). The model outlines four modes of knowledge conversion. Socialisation (Tacit to Tacit), knowledge is shared through observation, imitation, and practice, often in informal contexts. Externalisation (Tacit to Explicit), tacit insights are articulated into explicit concepts through dialogue, metaphors, or documentation. Combination (Explicit to Explicit), explicit knowledge is systematised, integrated, and disseminated, such as through databases or reports.

Internalisation (Explicit to Tacit), individuals absorb explicit knowledge through training, practice, and reflection, embedding it into personal expertise.

This cyclical process allows organisations to transform individual insights into collective knowledge assets, thereby fostering organisational learning and innovation. In the context of DX, the SECI model gains renewed significance because digital technologies enhance each mode of knowledge conversion. Socialisation, collaboration platforms and digital communities of practice enable geographically dispersed employees to share tacit knowledge in real time. Externalisation, tools such as knowledge bases, AI-assisted transcription, and workflow automation allow tacit knowledge to be codified into explicit digital records. Combination, advanced analytics, cloud platforms, and data integration tools support the consolidation of multiple knowledge sources, enabling predictive insights and holistic organisational intelligence. Internalisation, e-learning platforms, simulations, and AI-driven micro-learning accelerate the embedding of codified knowledge into individual practice, enhancing adaptability and decision-making.

The SECI model provides a practical lens for understanding how DX constructs can reinforce KM practices. The experiences of both customers and employees can be captured digitally and shared across sites (Socialisation). Tacit expertise from agricultural or production specialists can be documented through digital workflows (Externalisation). Knowledge from multiple African subsidiaries can be consolidated through centralised systems and dashboards (Combination). Digital training programmes and learning management systems can embed this knowledge into workforce practices (Internalisation). Thus, the SECI model demonstrates how DX provides the digital infrastructure and organisational environment to accelerate KM, ensuring that knowledge flows seamlessly across functions and geographies. This strengthens ABF Sugar Africa's ability to harness learning as a critical success factor for competitiveness and resilience.

2.5.1.2 Resource-Based View (RBV) and Knowledge-Based View (KBV)

The Resource-Based View (RBV), introduced by Barney (1991), argues that organisations achieve sustained competitive advantage by possessing resources that are valuable, rare, inimitable, and non-substitutable (VRIN). Such resources enable firms to outperform competitors by leveraging unique capabilities that cannot be easily replicated. The RBV categorises resources into tangible

and intangible, assets, with intangibles often being more decisive in ensuring long-term advantage. The Knowledge-Based View (KBV) extends RBV by positioning knowledge as the most strategically significant resource in organisations (Grant, 1996). According to KBV, competitive advantage arises not merely from possessing knowledge but from effectively creating, integrating, and applying it across the organisation. Knowledge is treated as a capability-building mechanism, shaping innovation, adaptability, and decision-making.

In the era of DX, RBV and KBV provide a critical lens for understanding how digital tools reinforce the strategic role of knowledge. Value in digital platforms such as data lakes, knowledge repositories, AI-driven search to enhance the value of knowledge by making it more accessible, contextualised, and actionable. Rarity in advanced analytics, predictive modelling, and proprietary digital systems allow organisations to generate unique insights that are not widely available in the market. Inimitability in knowledge embedded in organisational culture, digital workflows, and collective expertise becomes difficult for competitors to replicate when supported by integrated DX tools. Non-substitutability, the fusion of tacit expertise and digital systems creates organisational routines and decision frameworks that cannot be replaced by generic alternatives. Thus, DX acts as a capability amplifier, making knowledge assets more VRIN-compliant and thereby reinforcing their strategic role.

The RBV and KBV highlight how DX constructs such as leadership, technology, and culture are critical in turning fragmented knowledge into a coordinated organisational resource. Digital platforms enable the integration of dispersed expertise across multiple geographies (South Africa, Malawi, Zambia, Tanzania, and Eswatini), converting individual know-how into collective organisational capabilities. For example, predictive analytics on agricultural yields and supply chain data strengthens knowledge value by guiding operational and strategic decisions. Proprietary digital practices for sugar production and distribution become a rare and inimitable resource, not easily replicated by competitors. Integrated digital knowledge-sharing systems, underpinned by cultural openness and leadership sponsorship, make organisational knowledge non-substitutable. By aligning DX with KM through the RBV and KBV lenses, ABF Sugar Africa is better positioned to build innovation capacity, strategic responsiveness, and sustainable competitiveness in the African and global markets.

2.5.1.3 Dynamic Capabilities theory

The Dynamic Capabilities (DC) theory, developed by Teece, Pisano, and Shuen (1997), extends the Resource-Based View by emphasising a firm's ability to sense opportunities and threats, seize them through strategic action, and reconfigure resources and processes to sustain competitive advantage in turbulent environments. Unlike the static VRIN conditions of RBV, DC explicitly incorporates adaptability and renewal, making it particularly relevant in digital contexts characterised by rapid technological change and uncertainty. DC are not resources themselves but higher-order processes that enable the organisation to integrate, build, and reconfigure knowledge assets and competencies (Eisenhardt & Martin, 2000). These capabilities explain why some firms thrive during digital disruption while others falter, even when both have access to similar technological resources.

In the context of DX and KM, DC provide a crucial mediating lens. In Sensing, DX introduces advanced sensing mechanisms, big data analytics, AI, IoT, and digital customer interfaces, that allow firms to detect emerging opportunities, market shifts, and operational inefficiencies. KM systems capture and codify this knowledge, transforming raw signals into structured intelligence accessible across the organisation. Seizing, once opportunities are sensed, DX provides the digital platforms for firms to mobilise resources.KM ensures that best practices, expertise, and lessons learned are readily available to guide decision-making and execution.

Transforming/Reconfiguring, DX enables resource reconfiguration through automation, agile processes, and digital workflows. KM supports this by maintaining repositories of institutional knowledge, routines, and lessons that enable continuous learning and adaptation. Thus, DX creates the technological and organisational environment for sensing and seizing, while KM operationalises this capability by embedding insights into organisational routines, ensuring that transformation results in sustained innovation and performance outcomes (Teece, 2018; Warner & Wäger, 2019).

Operating across diverse African contexts, DC is critical in navigating environmental turbulence such as fluctuating commodity prices, regulatory shifts, and climate variability. Sensing, digital

agricultural monitoring (IoT sensors, satellite imagery) and customer demand analytics provide early signals about crop performance and market shifts. KM systems then codify this into decision-support dashboards. Seizing, cross-country digital collaboration platforms enable teams in South Africa, Malawi, Tanzania, Zambia, and Eswatini to share expertise and rapidly deploy best practices. KM ensures the knowledge is institutionalised rather than localised. Transforming through DX-enabled automation in supply chain and production processes, ABF Sugar Africa continuously reconfigures operations, while KM ensures lessons learned are fed back into strategy and training, creating a cycle of resilient adaptation. This demonstrates how DC, supported by DX and KM, equips ABF Sugar Africa not just to survive but to innovate and remain competitive in volatile environments.

2.5.1.4 Diffusion of Innovation theory

The Diffusion of Innovation (DOI) theory, developed by Rogers (2003), explains how new ideas and technologies spread within a social system over time. Adoption typically follows an S-curve, with distinct adopter categories: innovators, early adopters, early majority, late majority, and laggards. Each stage is influenced by factors such as perceived relative advantage, compatibility with existing values, complexity, trialability, and observability of outcomes (Rogers, 2003). In organisational settings, diffusion depends not only on individual adoption but also on institutional readiness, leadership sponsorship, and cultural openness to change (Greenhalgh et al., 2004). This makes DOI particularly relevant for understanding how DX and KM diffuse across firms.

Implications for the DX–KM links two-stage diffusion process. Stage one, DX diffusion, digital technologies must first diffuse across the organisation. This stage establishes the foundation of digital culture, user fluency, and infrastructure readiness. Stage two, KM diffusion, once DX is embedded, KM practices can diffuse more effectively. Employees are more likely to adopt KM tools when they already possess digital competence and when KM is aligned with their day-to-day digital workflows. Cultural readiness and social influence, the DOI framework emphasises the role of peer influence and social networks in adoption. In DX–KM integration, digital-savvy employees (innovators and early adopters) act as champions who demonstrate the benefits of KM practices, influencing the wider majority. Barriers, complexity of KM tools, lack of incentives, or perceived misalignment with work practices can slow diffusion (Hung et al., 2011). Enablers, leadership

advocacy, training, and visible benefits like faster problem resolution and better decision-making, accelerate adoption.

Diffusion occurs across multiple, each with different digital maturity levels. Innovators/early adopters might include IT teams or digital champions piloting advanced DX solutions like predictive analytics in agriculture. Early majority staff begin to adopt KM practices once they see tangible benefits, such as reduced downtime through shared best practices or improved collaboration across regions. Late majority and laggards may only adopt when KM systems are fully embedded in digital workflows and when leadership enforces accountability through governance mechanisms. Thus, DOI highlights that DX diffusion is a prerequisite to KM diffusion. Without widespread adoption of digital platforms, KM practices risk being siloed or underutilised.

2.5.2 Digital transformation theories

DX is more than the mere adoption of digital technologies; it is a strategic, structural, and cultural shift that reshapes how organisations operate, compete, and deliver value. To understand how organisations manage this transition, several theoretical perspectives have emerged, foremost among them is the Digital Capabilities theory. This theory complements and extends other related views such as DC theory, Sociotechnical Systems Theory, and the Technology-Organisation-Environment (TOE) framework. This section elaborates on these theoretical foundations to explain how digital transformation unfolds and how it intersects with knowledge management processes.

2.5.2.1 Digital Capabilities theory

Digital Capabilities theory emphasises the ability of organisations to build, integrate, and reconfigure resources to remain competitive in dynamic digital environments. According to Warner and Wäger (2019), digital capabilities are not merely technological assets but strategic enablers that encompass technological infrastructure, organisational agility, and human competencies. Vial (2019) similarly identifies digital capabilities as the foundation of digital transformation, enabling firms to adapt business models, processes, and customer engagement practices. Key dimensions of digital capabilities include technological capabilities in advanced platforms such as cloud computing, AI, big data analytics, and IoT that enable data-driven insights and scalable knowledge flows (Bharadwaj et al., 2013). Human capabilities, digital literacy, innovation mindset, and the capacity for continuous learning that allow employees to leverage

technology effectively (Kane et al., 2019). Organisational capabilities, agile structures, cross-functional collaboration, and business model innovation that integrate technology and people into competitive advantage (Warner & Wäger, 2019).

Digital capabilities directly determine the effectiveness of KM systems. Infrastructure for knowledge storage and access, cloud and AI platforms enable scalable, real-time access to knowledge repositories across geographically dispersed operations such as ABF Sugar Africa. Without such infrastructure, KM efforts risk remaining siloed and fragmented (Vial, 2019). Collaboration and knowledge sharing, digital platforms like collaboration suites and enterprise social media, facilitate tacit knowledge exchange and explicit codification, reinforcing the SECI model of knowledge creation (Nonaka & Takeuchi, 1995). Real-Time Learning and Adaptation: Analytics and machine learning tools embedded in DX allow continuous feedback loops, ensuring KM systems remain updated and relevant (Bharadwaj et al., 2013). Bridging global operations, for multinational organisations like ABF Sugar Africa, digital capabilities ensure interoperability across subsidiaries in different countries, allowing knowledge to be captured once and reused many times. Without strong digital capabilities, KM initiatives risk stagnation, failing to achieve strategic impact and being underutilised by employees. Conversely, when digital capabilities are fully developed, KM becomes embedded in organisational routines, leading to higher reuse, innovation, and competitive responsiveness.

2.5.2.2 Strategic responsiveness and digital sensing

Strategic responsiveness refers to an organisation's ability to sense, interpret, and rapidly respond to environmental changes. In the digital age, this capacity is increasingly enabled by digital sensing, which Teece, Peteraf, and Leih (2016) describe as the use of digital technologies to capture and interpret weak signals from markets, competitors, customers, and operations in real time. Digital sensing involves collecting data from multiple sources, such as customer interactions, IoT devices, supply chains, and social media, and transforming it into actionable insights. Studies emphasise that firms with advanced digital sensing capabilities develop superior situational awareness, allowing them to anticipate disruptions and act ahead of rivals (Tallon et al., 2019; Rossi et al., 2020). This is particularly vital in volatile environments, where responsiveness determines not only operational efficiency but also long-term competitiveness (Teece et al., 2016).

Digital sensing provides the *raw signals*, while KM ensures these signals are codified, contextualised, and disseminated across the organisation. Without KM, sensed information may remain underutilised leading to "*knowledge without action*." Conversely, KM without digital sensing risks being outdated, incomplete, or irrelevant. Recording and codifying signals, KM systems capture sensed insights, tagging and classifying them for retrieval and reuse (Alavi & Leidner, 2001). Disseminating insights, organisational KM processes ensure that market and operational intelligence is shared across teams, enhancing decision-making quality (Grant, 1996). Enabling strategic responsiveness, the integration of DX-driven sensing and KM-driven codification supports rapid scenario planning, strategic pivots, and innovation (Tallon et al., 2019). For organisations like ABF Sugar Africa, which operate in diverse and dynamic markets, digital sensing ensures timely detection of external and internal shifts, while KM translates these signals into knowledge assets that inform strategic decisions and innovation pipelines.

2.5.2.3 Sociotechnical Systems Theory and Technology-Organisation-Environment (TOE)

Trist and Bamforth (1951) introduced Sociotechnical Systems Theory (STS), emphasising the principle of joint optimisation: organisational performance is maximised only when technological systems and social systems (people, culture, and processes) are aligned. In the context of DX, STS highlights that introducing digital tools alone is insufficient unless accompanied by complementary changes in work design, leadership, and employee engagement (Baxter & Sommerville, 2011). Misalignment often leads to underutilisation of technologies, resistance to change, and knowledge silos (Pasmore, 2015). Tornatzky and Fleischer's (1990) TOE Framework provides a structured lens to explain technology adoption. It posits that successful adoption depends on three dimensions, Technological context such as features of the digital tools. Organisational context, internal characteristics for example, size, resources, culture, leadership and support. Environmental context, external factors such as regulation, industry pressures, and competitive dynamics. Within DX, the TOE framework explains why adoption rates and outcomes differ across organisations, even when similar technologies are deployed (Oliveira & Martins, 2011).

Together, STS and TOE perspectives reinforce the idea that KM success requires both digital enablers and social/organisational alignment. Digital enablers (DX), technologies such as AI, cloud computing, and collaborative platforms expand the capacity to capture, store, and share knowledge. Human/social systems, cultural openness, psychological safety, incentives, and governance structures determine whether knowledge is actually contributed, trusted, and reused. This means that KM implementation will succeed only if digital systems are interoperable (Technological context), employees are trained and incentivised (Organisational context), and environmental factors like market demands, compliance regulations are factored in. In other words, DX sets the potential for KM, but sociotechnical alignment and TOE conditions determine whether this potential translates into sustained knowledge flows and competitive advantage.

2.5.3 Integrated theoretical framework

Drawing from the DX and KM theories reviewed, this study develops an integrated predictive framework adapted from Lovrenčić and Sekovanić (2019) and contextualised for ABF Sugar Africa. The framework positions seven DX constructs, experiences, people, change, innovation, leadership, technology, and culture, as critical success factors that influence the effectiveness of KM implementation. These constructs operate not as isolated drivers but as interdependent enablers that shape the four KM pillars: organisation, leadership, learning, and technology

Experiences (CX/EX), Customer and employee interactions supply tacit and explicit knowledge, which can be codified into KM systems through SECI processes (Nonaka & Takeuchi, 1995). These experiences provide contextual insights that inform knowledge creation and organisational learning. People (skills, roles, incentives), human capital drives KM ownership, stewardship, and digital fluency (Kane et al., 2019). Employee capabilities and motivation directly influence how knowledge is captured, shared, and applied across organisational boundaries. Change (governance, adoption), governance structures, adoption pathways, and structured change management determine whether KM is institutionalised (Kotter, 2012). Effective change management facilitates the transition from individual knowledge practices to organisational capabilities. Leadership, digital leaders establish vision, allocate resources, and create accountability, embedding KM in strategic decision-making (Westerman et al., 2014). Leadership provides the strategic direction and organisational commitment necessary for sustainable KM implementation.

Technology, platforms and analytics provide the infrastructure for storing, retrieving, and analysing knowledge (Ly, 2023). Digital technologies enable the scalability and accessibility of knowledge assets across the organisation. Culture, trust, openness, and psychological safety foster collaborative knowledge sharing (Schein & Schein, 2017). Organisational culture creates the environmental conditions that either enable or constrain knowledge exchange behaviours. Innovation, experimentation pipelines transform KM into actionable insights that support new products, services, and processes (Teece, 2018). Innovation capabilities ensure that knowledge assets contribute to organisational renewal and competitive advantage. These DX constructs collectively influence KM's four core constructs, organisation, leadership, learning, and technology, by shaping ownership structures, codification routines, knowledge-sharing behaviours, and infrastructure.

The effect of DX on KM is further illustrated in 2.1. On the left, the six empirically tested DX constructs (leadership, culture, people, change, innovation, technology) act as independent variables. On the right, the four KM constructs (leadership, organisation, technology, learning) represent dependent variables, with specific pathways corresponding to research questions RQ1-RQ6. The integrated relationship (RQ7) encompasses the collective predictive power of all DX constructs on overall KM implementation effectiveness. This framework provides the empirical blueprint for testing which specific DX constructs most significantly influence targeted KM outcomes at ABF Sugar Africa.

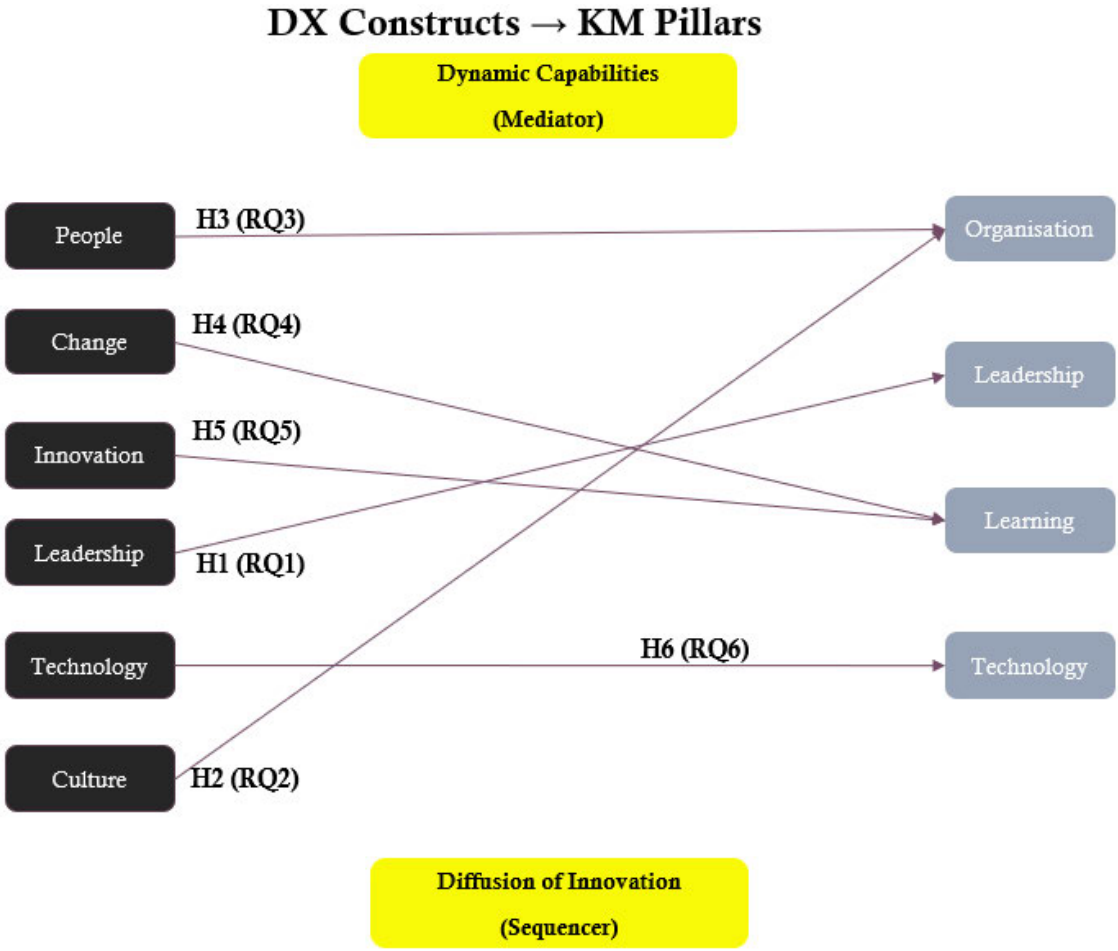

Figure 2. 1 Integrated predictive framework

DC as Mediator: Dynamic Capabilities theory explains how organisations sense, seize, and transform resources (Teece et al., 1997; Teece, 2018). In this framework, DX provides the sensing and reconfiguring tools, such as AI, big data analytics, and IoT platforms, whilst KM operationalises these capabilities into stored knowledge and deployable organisational routines. This positions DC as the mediating mechanism that links DX maturity with KM effectiveness, particularly in the transformation of digital inputs into knowledge-based organisational capabilities.

DOI as Sequencer: Diffusion of Innovation theory helps explain the sequencing whereby DX adoption precedes KM adoption (Rogers, 2003). This sequential relationship suggests that in most organisations, digital tools, platforms, and practices (DX) are adopted first, for example, cloud platforms, collaboration applications, ERP systems, and AI dashboards. Only after these digital

foundations are established do organisations tend to adopt or scale systematic KM practices, such as knowledge-sharing platforms, lessons-learned databases, and communities of practice. Without a baseline of digital maturity, KM practices often struggle to diffuse effectively, since employees lack the technological readiness and cultural incentives necessary for sustained adoption. DOI therefore frames the temporal order in which transformation unfolds: first, digital capability adoption and maturation; subsequently, KM systematisation and institutionalisation. This sequencing is particularly relevant in the African context, where infrastructure limitations and digital literacy gaps may influence the pace and success of both DX and KM implementation.

2.6 Conceptual framework

This study is guided by a conceptual framework that links DX constructs (independent variables) to KM constructs (dependent variables). Conceptual frameworks in quantitative research specify hypothesised relationships that are empirically testable (Creswell, 2023). The framework is informed by the integrated DX–KM model, the KBV, the SECI model, DOI and DC (Lovrenčić & Sekovanić, 2019; Nonaka & Takeuchi, 1995; Grant, 1996; Teece, 2018). Collectively, these theories position organisational enablers of DX as antecedents to KM success.

2.6.1 Independent variables (DX constructs)

Culture, organisational culture reflects shared values, norms, and practices that shape collective behaviour (Schein, 2017). In digitally transforming organisations, adaptive and learning-oriented cultures are critical for enabling knowledge sharing and continuous innovation (Westerman et al., 2014). A culture that emphasises openness and collaboration is therefore expected to positively influence KM processes such as knowledge creation and organisational learning. Leadership, leadership is consistently identified as a central enabler of both DX and KM (Cortellazzo et al., 2019). Transformational and supportive leaders foster trust, motivation, and alignment with organisational vision, thereby encouraging active participation in KM initiatives (Nonaka et al., 2006). Leaders also serve as champions of knowledge practices by mobilising resources, providing incentives, and articulating strategic direction. Innovation, innovation reflects the organisational capacity to generate and implement new processes, products, and services (Drucker, 2014). Within DX contexts, innovation is closely linked to KM, as effective knowledge utilisation enhances

creativity, problem-solving, and adaptability (Papa et al., 2018). Organisations with higher levels of innovation are therefore hypothesised to exhibit stronger KM implementation.

Change captures the organisation's ability to adapt to and manage transformation processes. Kotter's (1996) framework stresses that successful change requires clear communication, urgency, and consolidation of gains. Because KM adoption often necessitates structural and behavioural shifts, effective change management is expected to positively influence KM leadership, organisational alignment, and learning. People, human capital is central to both DX and KM since individuals are the primary agents of knowledge creation, sharing, and application (Becker, 2009). Employees' skills, motivation, and readiness to engage in KM practices are therefore critical determinants of KM success (Dalkir, 2017). Consequently, people-related factors are positioned as core predictors of KM adoption. Technology, technology functions as both a driver and enabler of KM (Alavi & Leidner, 2001). Digital platforms, analytics, and collaborative tools provide the infrastructure for capturing, storing, and sharing knowledge. Within DX contexts, investments in robust IT systems are hypothesised to directly enhance KM technology adoption and indirectly strengthen KM learning and organisational efficiency.

Experiences, organisational experiences, both successes and failures, form the collective memory that guides future decisions (Argote, 2013). Experiential learning embeds best practices and reduces repetitive errors, thereby enhancing knowledge processes. In digitally transforming environments, leveraging organisational experiences is expected to strengthen KM leadership and learning outcomes.

2.6.2 Dependent variables (KM constructs)

KM leadership refers to leaders' ability to articulate a vision for KM, secure resources, and align KM practices with organisational goals (Nonaka et al., 2006). Strong KM leadership ensures that knowledge processes are embedded in organisational routines. KM organisation captures the structures, policies, and practices that facilitate knowledge sharing and application across organisational units. Institutionalising KM practices is essential for integration across the enterprise (Gold, Malhotra, & Segars, 2001). KM technology represents the systems and tools that enable knowledge capture, storage, and dissemination. Effective KM technology enhances

accessibility, collaboration, and evidence-based decision-making (Alavi & Leidner, 2001). KM learning refers to the processes by which organisations acquire, interpret, and apply new knowledge. Organisational learning is essential for adaptability, innovation, and competitive advantage in dynamic environments (Easterby-Smith & Lyles, 2011).

2.6.3 Hypotheses

Drawing on the theoretical foundations established through the Knowledge-Based View (KBV), SECI model, DC theory, and DOI theory, this framework proposes that specific DX constructs serve as independent variables influencing targeted KM constructs as dependent variables. The revised hypotheses eliminate non-tested relationships and ensure strict alignment with the seven research questions formulated for this study:

1. H1: DX Leadership positively influences KM Leadership implementation at ABF Sugar Africa.
    a. Digital leaders establish vision, allocate resources, and create accountability structures that embed KM into strategic decision-making processes (Westerman et al., 2014). Leadership provides the strategic direction and organisational commitment necessary for sustainable KM implementation, directly influencing how KM leadership capabilities are developed and institutionalised.
2. H2: DX Culture positively influences KM Organisation structures and processes.
    a. Organisational culture creates the environmental conditions that either enable or constrain knowledge exchange behaviours (Schein & Schein, 2017). Trust, openness, and psychological safety foster collaborative knowledge sharing, directly shaping how KM organisational structures, policies, and governance mechanisms are established and sustained.
3. H3: People capabilities positively influence KM Organisation effectiveness.
    a. Human capital drives KM ownership, stewardship, and digital fluency (Kane et al., 2019). Employee capabilities, motivation, and role clarity directly influence how knowledge is captured, shared, and embedded within organisational structures, affecting the overall effectiveness of KM organisational arrangements.

4. H4: DX Change management positively influences KM Learning capabilities.

a. Governance structures, adoption pathways, and structured change management determine whether KM becomes institutionalised as a learning capability (Kotter, 2012). Effective change management facilitates the transition from individual knowledge practices to organisational learning systems and continuous improvement processes.

5. H5: DX Innovation significantly enhances KM Learning and knowledge asset renewal.
    a. Innovation capabilities ensure that knowledge assets contribute to organisational renewal and competitive advantage (Teece, 2018). Experimentation pipelines transform KM into actionable insights that support new products, services, and processes, directly enhancing organisational learning capabilities.

6. H6: DX Technology positively strengthens KM Technology capabilities and infrastructure.
    a. Digital platforms and analytics provide the technological infrastructure for storing, retrieving, and analysing knowledge (Ly, 2023). Technology readiness and interoperability directly enable the scalability and accessibility of knowledge assets across the organisation, enhancing KM technological capabilities.

7. H7: Integrated DX constructs collectively predict overall KM implementation effectiveness at ABF Sugar Africa.
    a. The systems view recognises that DX constructs operate as interdependent enablers rather than isolated variables. The collective influence of leadership, culture, people, change, innovation, and technology creates synergistic effects that determine overall KM implementation success, reflecting the integrated nature of digital transformation in enabling KM outcomes.

This hypothesis structure addresses ensures that each hypothesis corresponds directly to the specific research questions (RQ1-RQ7) and eliminates any theoretical relationships not empirically tested in this study. The framework reflects a parsimonious systems view that recognises DX constructs as interdependent enablers of KM success whilst maintaining empirical testability. Whilst the primary hypotheses focus on direct relationships aligned with the research

questions, the theoretical framework acknowledges that DC serve as mediating mechanisms linking DX maturity with KM effectiveness, and that DOI explains the sequential adoption patterns whereby DX capabilities typically precede KM institutionalisation. These hypotheses will be tested using PLS-SEM, correlation analysis, and multiple regression techniques to determine the magnitude, direction, and statistical significance of each hypothesised relationship. The integrated predictive model (H7) will be validated through comprehensive analysis of all DX constructs' collective predictive power on KM implementation effectiveness.

2.7 Chapter summary

This chapter critically examines the theoretical and empirical foundations of DX and KM, identifying the interplay between these domains and the gaps that justify the current study. Empirically, four core KM processes, creation, organisation, sharing, and application, are underpinned by technological platforms (KMS) but depend equally on culture, leadership, and strategic alignment. Studies show that although digital tools (cloud computing, AI, analytics) accelerate KM, their success hinges on human-centred factors such as digital fluency, role clarity, and incentives. Seven DX constructs emerge as critical success factors: experiences, people, change, innovation, leadership, technology, and culture. Each construct influences one or more of the four KM pillars, organisation, leadership, learning, and technology, yet their combined, synergistic effect is necessary for sustained KM success. Despite extensive qualitative and conceptual work, significant gaps persist. Quantitative measurement of DX constructs' effects on KM outcomes is scarce; human-centred variables are under-operationalised; system integration and interoperability receive limited attention; most research is Western-centric with little validation in African contexts; and strategic outcomes beyond adoption metrics are rarely linked to KM effectiveness. The theoretical review integrates four domains.

The SECI model illustrates how DX amplifies knowledge conversion. Resource-Based and Knowledge-Based Views position knowledge as a strategically valuable resource enhanced by DX. Dynamic Capabilities theory explains how organisations sense and reconfigures digital, and knowledge assets, with DX supplying sensing tools and KM embedding routines. Diffusion of Innovation frames the adoption sequence, where digital maturity typically precedes KM institutionalisation. Culminating in a refined predictive framework, the chapter aligns seven DX

constructs with targeted KM outcomes, strictly corresponding to the study's research questions. Dynamic Capabilities act as mediators and DOI explains sequencing. This framework serves as the empirical blueprint for quantitative testing at ABF Sugar Africa, promising theoretical advancement through contextual validation and practical guidance for designing knowledge-centric digital transformation strategies in emerging economies.

The upcoming chapters will elaborate on the conceptual framework, including hypotheses derived from the literature, and detail the research methodology, including sampling, data collection, and analysis techniques.

CHAPTER THREE: RESEARCH METHODOLOGY

3.1 Introduction

This chapter outlines the quantitative research methodology adopted to investigate the influence of DX constructs on KM adoption and implementation within ABF Sugar Africa. The study is guided by a positivist paradigm, which assumes that organisational realities can be measured and explained through empirical observation and statistical analysis (Creswell & Creswell, 2018). The choice of methodology is informed by two considerations. First, existing literature highlights strong theoretical linkages between DX constructs (leadership, culture, innovation, change, people, and technology) and KM outcomes (leadership, organisation, learning, and technology), yet limited empirical validation exists in African contexts (Boateng, 2021; Vial, 2019). Second, a structured quantitative design enables the researcher to test hypotheses, establish predictive relationships, and produce findings that are replicable, generalisable, and practically relevant for organisations undergoing DX.

Accordingly, this methodology chapter is structured as follows, research strategy, conceptual framework, data collection, sampling procedures, data analysis framework, reliability and validity, and ethical considerations.

3.2 Research Strategy

This study employs a deductive, cross-sectional quantitative survey design within a positivist paradigm to test the hypotheses derived from the integrated DX to KM framework and aligned directly with the research questions (RQs). Positivism presumes that organisational phenomena can be observed and measured objectively, allowing statistical analysis to confirm or refute theoretical propositions (Creswell & Creswell, 2018). The deductive process begins with established theories and the conceptual model, linking specific DX constructs (leadership, culture, people, change, innovation, technology) to discrete KM outcomes (leadership, organisation, learning, technology), and formulates hypotheses that correspond exactly to RQ1–RQ7.

Three considerations render this approach particularly appropriate. First, the literature provides robust theoretical underpinnings for each hypothesised link: for example, RQ1/H1 examines how

DX leadership shapes KM leadership, and RQ2/H2 tests the influence of DX culture on KM organisational structures. Second, a deductive survey enables empirical testing of these precise hypotheses, advancing the field from descriptive discussion to predictive modelling of KM implementation outcomes. Third, this strategy enhances replicability and generalisation, as the same instrument can be administered across ABF Sugar Africa's five national operations (South Africa, Zambia, Malawi, Tanzania, Eswatini), ensuring consistency in measurement and the capacity to compare results across contexts (Saunders et al., 2019).

A cross-sectional survey captures managerial perceptions at a single point in time and is both logistically efficient and methodologically rigorous for a multinational organisation. The structured questionnaire employs Likert-scale items to measure each DX construct and its corresponding KM outcome precisely, supporting internal consistency assessment (Cronbach's α) and construct validity (Hair et al., 2019). This design allows for the robust statistical examination of direct effects (H1–H6) and the integrated effect of all DX constructs on overall KM effectiveness (H7), as specified in the framework. Alternative designs were considered but found less suitable. Longitudinal studies would offer richer causal insights but exceed available resources and fail to deliver timely guidance for ongoing digital transformation initiatives. Qualitative or mixed methods approaches, while valuable for contextual depth, lack the capacity to test the full set of hypotheses or generate statistically generalisable findings across multiple countries. The chosen deductive, cross-sectional quantitative survey strategy therefore provides a rigorous, efficient, and directly aligned method for empirically validating the DX–KM framework and its associated hypotheses, ensuring that research outcomes both refine theory and inform practice in an African digital transformation context.

3.3 Data collection

3.3.1 Instrument design

Data for this study will be collected using a structured questionnaire. A structured instrument is particularly appropriate in quantitative research because it provides standardised data that is comparable across respondents and contexts, ensuring reliability and facilitating statistical analysis (Creswell, 2023). The instrument was developed around the integrated DX–KM framework, with sections designed to capture both demographic data and the key constructs under investigation.

Section A is demographics, this section gathers descriptive data such as country of operation, role, department, and tenure. Such variables are essential for contextualising responses and allowing subgroup analyses (Fowler, 2014). In multi-country and multi-department studies, demographic items also enhance the ability to explore whether DX and KM perceptions vary across geographies and organisational levels. Section B is DX culture items assess cultural dimensions such as knowledge-sharing norms, openness, and collaborative values. Organisational culture strongly shapes KM behaviours (Schein, 2010; Westerman et al., 2014). Including these items allows the study to test whether a learning-oriented culture predicts KM success.

Section C is DX leadership, people and innovation, leadership sponsorship, employee skills, and innovation-related incentives are assessed here. Leadership and people-related factors are critical antecedents of KM adoption (Bass & Avolio, 1994; Nonaka & Takeuchi, 1995). Innovation measures reflect the organisation's capacity to leverage knowledge for renewal and adaptation (Drucker, 2014; Papa et al., 2018). Section D is DX change, change readiness and organisational experiences (employee and customer) are measured, as KM implementation often requires transformation of behaviours, processes, and attitudes (Kotter, 1996; Armenakis & Harris, 2009). Capturing experiences acknowledges the organisational learning lens, where past successes and failures shape KM practices (Argote, 2013). Section E is DX technology, items examine technology adoption, platform use, and interoperability of systems. Robust IT infrastructures provide the backbone for KM processes by facilitating knowledge capture, dissemination, and retrieval (Alavi & Leidner, 2001). Section F is KM outcomes, this section measures dependent variables, KM leadership, organisation, technology, and learning practices. Items are adapted from validated KM scales (Gold, Malhotra, & Segars, 2001; Nonaka & Takeuchi, 1995).

All measurement items will use a 5-point Likert scale ranging from strongly disagree (1) to strongly agree (5). Likert scales are widely used in organisational and management research because they generate interval-level data suitable for parametric statistical analysis, while capturing the intensity of respondent attitudes (Joshi et al., 2015). Using standardised scales also enhances comparability across the five operational countries included in the study. The questionnaire design process drew on validated items from established DX and KM literature (Schein, 2010; Bass & Avolio, 1994; Kotter, 1996; Nonaka & Takeuchi, 1995). This practice

ensures content validity, as constructs are measured consistently with prior research, enabling theoretical and empirical alignment (DeVellis, 2017).

3.3.2 Pilot testing

Prior to full deployment, the questionnaire underwent pilot testing with 10 respondents representing diverse departments within ABF Sugar Africa. Creswell (2023) recommends pilot testing as a critical step to identify ambiguities, test item interpretation, and refine instrument layout before large-scale administration. The pilot process revealed areas of redundancy and potential confusion, which were addressed by rewording items and simplifying instructions. Feedback was also used to confirm whether respondents interpreted Likert items consistently, thereby strengthening construct validity. Instrument reliability was assessed using Cronbach's alpha ($\alpha \geq 0.70$), which is a widely accepted threshold for internal consistency in social sciences (Nunnally & Bernstein, 1994). Items with low item-total correlations were revised or removed. Achieving this threshold confirmed that the instrument items reliably measure the intended constructs. Pilot testing also ensured face validity (respondents felt items captured the intended concepts) and practical feasibility, particularly in terms of survey length and completion time. This step reduces non-response bias and enhances respondent engagement in the final data collection phase (Fink, 2017).

3.4 Sampling Design

3.4.1 Target population

This study focuses on managerial and supervisory staff with decision-making responsibilities and direct exposure to organisational change and knowledge initiatives. This includes senior managers, managers, supervisors and team leads that are one level below managers. Within the following functional areas central to DX and KM practices are Finance, Procurement, Information Technology (IT), Agriculture, Sales and Marketing.

This refined focus ensures that responses come from knowledge-rich informants who are actively engaged in KM practices and DX processes. Limiting the study population in this way increases the construct validity of findings, since targeted respondents are best positioned to evaluate the alignment between DX constructs and KM outcomes (Etikan et al., 2016). Preliminary HR records

indicate that this managerial subset comprises approximately 246 employees, subject to verification. By narrowing the focus, the study balances breadth of multiple countries and functions, with depth of respondents' direct relevance to the research constructs.

3.4.2 Sampling technique

Given the geographical dispersion of ABF Sugar Africa across five countries, combined with logistical and regulatory constraints such as the Protection of Personal Information Act (POPIA) in South Africa, the study employs a non-probability, convenience sampling strategy. Convenience sampling is appropriate when accessibility, time, and cost considerations limit the feasibility of randomised selection (Creswell & Creswell, 2018). More importantly, it is well suited to organisational research involving specific managerial roles where the primary goal is not statistical representativeness of the entire workforce, but rather focused insights from key knowledge actors (Sekaran & Bougie, 2016). To ensure ethical and organisational compliance, HR offices and site managers act as intermediaries in distributing surveys and verifying eligibility. This approach aligns with ethical protocols for data access and ensures voluntary participation without coercion (Dillman, Smyth, & Christian, 2014). Although non-probability sampling limits generalisability to the entire workforce, its targeted selection of knowledgeable respondents enhances internal validity and supports the study's analytical aims.

3.4.3 Sample size

The sample size was calculated using a 95% confidence level and 5% margin of error, which are widely accepted thresholds in organisational and social science research (Saunders, Lewis, & Thornhill, 2019). Using the formula n = Z^2.p(1−p) / E^2 where Z = 1.96 (value corresponding to 95% confidence level), p = 0.5 (assumed response proportion for maximum variability), and E = 0.05 (margin of error). The resulting minimum required sample size is 150 respondents. This figure ensures sufficient statistical power to detect significant effects in regression analyses and hypothesis testing. It also exceeds the recommended minimum sample size for multivariate analysis, where a ratio of 10–15 cases per variable is typically suggested (Hair et al., 2019). By targeting a sample of 150 out of the 246 eligible employees, the study achieves a robust coverage of 61% of the managerial population, balancing feasibility with methodological rigour. This

enhances the credibility and generalisability of results within the managerial strata, while remaining feasible given the cross-country context.

3.4.4 Sampling limitations

While the chosen sampling design is methodologically justified, certain limitations must be acknowledged. First, the use of non-probability convenience sampling restricts the ability to generalise findings to the entire ABF Sugar Africa workforce. As Etikan et al. (2016) caution, convenience samples may introduce selection bias, since participants are not randomly chosen. However, this limitation is mitigated by deliberately targeting managerial and supervisory staff, who are the most relevant respondents for assessing DX and KM integration. Second, reliance on voluntary participation may introduce self-selection bias, where individuals with strong opinions or higher engagement in KM/DX may be more likely to respond (Dillman, Smyth, & Christian, 2014). This can affect representativeness. Nonetheless, this study's focus is not to generalise across all employees, but to capture insights from knowledge-rich informants whose roles directly influence KM adoption.

Finally, the multi-country context presents practical constraints, including data access restrictions under the POPIA in South Africa, as well as organisational gatekeeping in other jurisdictions. These constraints necessitated the use of HR offices and site managers as intermediaries, which may affect the uniformity of survey distribution. Despite these limitations, the chosen approach ensures ethical compliance, practical feasibility, and alignment with the study objectives (Creswell & Creswell, 2018; Saunders et al., 2019).

3.5 Data analysis framework

This study's data analysis followed a pre-defined, six-stage procedure to ensure methodological accuracy, theoretical alignment, and empirical validity. Prior to conducting the six-stage analytical procedure, raw data underwent systematic preparation and screening to ensure dataset quality and compliance with statistical assumptions. Missing values were managed using listwise deletion for cases where responses were incomplete (Hair et al., 2019), ensuring complete datasets for all inferential procedures whilst preserving statistical power.

Normality assessments were conducted using skewness and kurtosis indices, applying thresholds of ±2 for skewness and ±7 for kurtosis as indicators of acceptable univariate normality (Field, 2018; West, Finch, & Curran, 1995). Outliers were examined using boxplots and standardised z-scores (±3.29), with extreme cases evaluated for legitimacy before exclusion (Tabachnick & Fidell, 2019).All analyses were conducted using SPSS version 29.0 and SmartPLS for Partial Least Squares Structural Equation Modelling (PLS-SEM), tools widely recognised for their capacity to manage large datasets and execute advanced statistical techniques in social science research (Field, 2018; Pallant, 2020). The analysis followed a six-stage process, with results presented in the same sequential order in Chapter Four:

3.5.1 Stage One: Descriptive Statistics

Stage One is the descriptive statistics focusing on the frequencies, percentages, Mean and standard deviations were computed to profile the sample (country, role, tenure) and examine data distributions. This initial step grounds the study in an understanding of the managerial population at ABF Sugar Africa and establishes the context for subsequent inferential analyses (Creswell & Creswell, 2018). Descriptive analysis is an essential preliminary step in quantitative research, serving multiple methodological functions. First, it enables the researcher to understand the composition of the sample across key demographic dimensions such as country of operation, organisational role, departmental affiliation, and tenure. This contextual understanding is critical for interpreting findings within the specific organisational environment of ABF Sugar Africa, particularly given its multi-country operational structure spanning South Africa, Zambia, Malawi, Tanzania, and Eswatini.

Second, descriptive statistics provide evidence of data quality and distributional characteristics. By computing measures of central tendency (mean), dispersion (standard deviation), and shape (skewness and kurtosis), the researcher can assess whether data meet the assumptions of parametric statistical tests employed in subsequent stages (Field, 2018). This assessment directly informs decisions regarding the appropriateness of correlation, regression, and structural equation modelling techniques. Third, demographic profiling supports the study's external validity by demonstrating the representativeness of the sample relative to the target population of managerial and supervisory staff. Understanding the distribution of respondents across countries, departments,

and role levels enhances confidence in the generalisability of findings within similar African multinational contexts (Saunders, Lewis, & Thornhill, 2019).

Stage One establishes the empirical foundation for the study. Profiling the managerial population at ABF Sugar Africa, grounding the investigation in a clear understanding of who the respondents are and what organisational contexts they represent. Confirming data quality and distributional characteristics, ensuring methodological rigour and appropriateness of subsequent statistical techniques. Providing contextual insights that inform the interpretation of relationships between DX constructs and KM outcomes in later stages. This stage does not test hypotheses directly but provides the necessary contextual and diagnostic information that enables robust hypothesis testing in Stages Two through Six.

3.5.2 Stage Two: Correlation Analysis

Stage Two is correlation analysis using Pearson's r coefficients will be calculated to assess the strength and direction of bivariate relationships between each DX construct (leadership, culture, people, change, innovation, technology) and its corresponding KM outcome (KM leadership, KM organisation, KM learning, KM technology). Correlation analysis provides preliminary evidence of associations, guiding hypothesis testing in later stages (Pallant, 2020).

The integrated DX-KM framework (Section 2.5.3) posits specific linkages between constructs:

- DX Leadership should correlate with KM Leadership (H1)
- DX Culture should correlate with KM Organisation (H2)
- DX People capabilities should correlate with KM Organisation (H3)
- DX Change should correlate with KM Learning (H4)
- DX Innovation should correlate with KM Learning (H5)
- DX Technology should correlate with KM Technology (H6)

Correlation analysis provides the first empirical test of these theoretical propositions. Significant positive correlations would offer preliminary support for the hypothesised relationships, indicating that increases in DX constructs are associated with increases in corresponding KM outcomes. Conversely, non-significant or weak correlations would suggest either theoretical misspecification or the presence of confounding variables requiring further investigation. Methodologically,

correlation analysis also serves a diagnostic function by identifying potential multicollinearity issues, situations where independent variables are highly correlated with one another, which can distort regression estimates in Stage Three (Field, 2018). Correlation coefficients exceeding .80 would signal multicollinearity concerns requiring remedial action such as variable aggregation or removal.

Pearson product-moment correlation coefficients (r) were calculated for all pairwise combinations of DX constructs and KM outcomes using SPSS version 29.0. The Pearson r is the most appropriate measure of linear association for continuous, interval-level data derived from Likert scales (Pallant, 2020). Stage Two directly addresses the study's research questions by providing the first quantitative evidence of relationships between DX constructs and KM outcomes. This stage transitions the analysis from descriptive characterisation to relational investigation, establishing the empirical foundation for multivariate predictive modelling in subsequent stages.

3.5.3 Stage Three: Multiple Regression Analysis

Stage Three is multiple regression for each hypothesised pathway (H1–H6), multiple regression models are estimated to determine the predictive power of specific DX constructs on KM constructs. Standardised β-coefficients and R^2 values quantify each construct's relative contribution, directly addressing the study's research questions on which DX factors most significantly influence KM outcomes (Hair et al., 2019). Whilst, correlation analysis (Stage Two) establishes whether relationships exist, multiple regression analysis addresses how much variance in KM outcomes is explained by DX constructs and which specific constructs exert the strongest influence. This analytical advancement is critical for several reasons.

First, theoretical specification, the integrated DX-KM framework in Chapter Two posits that multiple DX constructs simultaneously influence KM outcomes. Multiple regression enables the researcher to model this multivariate reality by estimating the effect of each DX construct whilst holding other constructs constant (Field, 2018). This statistical control isolates the unique predictive contribution of each variable, addressing potential confounding and providing a more accurate representation of causal pathways. Second, hypothesis testing, each of the six primary hypotheses (H1–H6) specifies a directional relationship between a DX construct and a KM

outcome. Multiple regression produces standardised regression coefficients (β) and significance tests (*p*-values) that enable the researcher to formally accept or reject each hypothesis. Standardised coefficients also enable direct comparison of effect sizes, revealing which DX constructs are the strongest predictors of KM success.

Third, explained variance, the R^2 statistic quantifies the proportion of variance in the dependent variable (KM outcome) explained by the set of independent variables (DX constructs). High R^2 values indicate that the model successfully captures the factors driving KM effectiveness, whilst low R^2 values suggest omitted variables or model misspecification (Hair et al., 2019). Fourth, practical utility, regression coefficients translate into actionable insights for practitioners. For example, a large positive β for DX Leadership to KM Leadership indicates that leadership interventions are likely to yield substantial improvements in KM practices, informing resource allocation and change management priorities at ABF Sugar Africa.

Multiple regression models will be estimated using SPSS version 29.0, employing the Enter method to include all theoretically specified predictors simultaneously. Separate regression equations were specified for each KM outcome. This stage represents the core empirical contribution of the study, moving beyond descriptive and correlational evidence to establish predictive relationships that inform both theory development and organisational practice.

3.5.4 Stage Four: Exploratory Factor Analysis (EFA)

Stage Four is Exploratory Factor Analysis (EFA). EFA is utilised to assess instrument dimensionality and construct validity. Principal axis factoring with oblique rotation tested whether survey items loaded on the theoretical factors specified by the integrated DX–KM framework. This step reduces measurement error and confirms that observed variables accurately represent latent constructs (Fabrigar & Wegener, 2012). Construct validity is a foundational requirement for quantitative research, referring to the degree to which a measurement instrument accurately captures the theoretical constructs it purports to measure (Creswell & Creswell, 2018).

Without construct validity, empirical findings lack interpretive meaning, researchers cannot confidently claim that observed relationships between variables reflect relationships between the underlying theoretical constructs. EFA serves multiple methodological functions:

i. Dimensionality assessment: The theoretical framework specifies that the instrument measures seven distinct DX constructs (Leadership, Culture, People, Change, Innovation, Technology, Experiences) and four distinct KM constructs (Leadership, Organisation, Learning, Technology). EFA empirically tests whether survey responses conform to this theoretical structure. If items designed to measure "DX Leadership" load onto a single factor distinct from other constructs, this provides evidence of one-dimensionality, each construct represents a coherent, singular concept (Hair et al., 2019).
ii. Measurement error reduction: Survey items are imperfect indicators of latent constructs, containing both true score variance (the construct of interest) and error variance (random noise, method artefacts, respondent misinterpretation). EFA identifies items with low factor loadings, those that contribute more error than signal, enabling their removal or revision. This process enhances internal consistency and reliability (Fabrigar & Wegener, 2012).
iii. Discriminant validity, the theoretical framework posits that DX constructs are conceptually distinct from one another and from KM outcomes. EFA tests this assumption by examining whether items load uniquely onto their intended factors or exhibit substantial cross-loadings. Clean factor structures with minimal cross-loadings provide evidence of discriminant validity, constructs are empirically distinguishable (Fornell & Larcker, 1981).
iv. Data reduction and parsimony, EFA identifies the minimum number of factors necessary to explain the observed covariance among items. If the theoretical structure is empirically supported, researchers can proceed with confidence that the measurement model is both theoretically meaningful and empirically parsimonious.

Stage Four ensures that the measurement instrument possesses the psychometric properties necessary to support valid hypothesis testing. This stage does not test hypotheses directly but provides the psychometric foundation that enables valid hypothesis testing in multivariate models.

3.5.5 Stage Five: Mediation and Moderation Analysis

Stage Five is mediation and moderation analysis using Hayes' PROCESS macro for SPSS (Model 4 and Model 1), indirect effects (mediation) and conditional effects (moderation) will be tested. For example, the mediating role of DC in the DX leadership to KM leadership relationship and the moderating effect of culture on the DX technology to KM technology link will be examined. This analysis offers nuanced insights into the complex interplay of organisational factors (Hayes, 2018). Mediation analysis examines whether a third variable (the mediator) explains the mechanism through which an independent variable influences a dependent variable (Baron & Kenny, 1986; Hayes, 2018). In the DX-KM framework, mediation tests the proposition that organisational capabilities serve as the "black box" that transforms digital investments into knowledge outcomes.

Dynamic Capabilities theory (Teece, 2018) posits that organisations sense, seize, and transform resources through dynamic capabilities, higher-order competencies that enable adaptation and renewal. Testing mediation reveals how DX leadership influences KM leadership. Does leadership directly create KM effectiveness, or does it first build digital capabilities, which subsequently enable KM practices? This distinction has profound practical implications for intervention design. Moderation analysis examines whether the strength or direction of a relationship between an independent variable and a dependent variable changes depending on the level of a third variable (the moderator). In the DX-KM framework, moderation tests the proposition that organisational culture creates environmental conditions that amplify or attenuate the effectiveness of DX investments.

Mediation and moderation analyses were conducted using Hayes' (2018) PROCESS macro for SPSS, a widely validated computational tool for testing indirect and conditional effects. Model 4 in PROCESS tests simple mediation, where the effect of an independent variable (X) on a dependent variable (Y) operates through a mediator (M). Model 1 in PROCESS tests simple moderation, where the effect of an independent variable (X) on a dependent variable (Y) depends on the level of a moderator (W). Stage Five represents a methodologically advanced contribution that distinguishes this study from prior DX-KM research, which typically examines only direct relationships.

3.5.6 Stage Six: Integrated Predictive Model Using PLS-SEM

Stage Six is integrated predictive model on results from Stages 2–5 synthesised into an integrated PLS-SEM model. This comprehensive model tests H7, examining the collective influence of all seven DX constructs on overall KM implementation effectiveness. By consolidating direct, indirect and interaction effects, the model presents a holistic understanding of how digital transformation drives knowledge management success. The preceding analytical stages have examined individual relationships between DX constructs and KM outcomes (Stages Two and Three) and complex mediating and moderating mechanisms (Stage Five). Stage Six integrates these findings into a systems view that recognises DX constructs as interdependent enablers rather than isolated variables operating in parallel.

Organisations are complex systems where constructs interact synergistically. The collective influence of leadership, culture, people, change, innovation, technology, and experiences creates emergent effects that exceed the sum of individual contributions (Senge, 2006). A systems model captures these synergies. DC theory (Teece, 2018) posits that organisational capabilities integrate multiple resources, leadership vision, employee skills, technological infrastructure, cultural norms, into coherent routines that enable adaptation and renewal. The integrated model operationalises this theoretical proposition by examining how DX constructs collectively constitute the organisational capability to implement KM effectively. Managers do not implement DX constructs in isolation, they must orchestrate leadership commitment, cultural change, technology investments, and capability-building simultaneously. The integrated model reflects this practical reality, providing guidance on which combinations of DX constructs yield the highest KM effectiveness and how much total variance can be explained by digital transformation initiatives.

PLS-SEM is particularly appropriate for this analysis for several methodological reasons:

i. PLS-SEM handles models with numerous constructs, pathways, and latent variables without requiring large sample sizes. This study's framework includes seven DX constructs, four KM constructs, and multiple hypothesised pathways, a level of complexity suited to PLS-SEM (Hair et al., 2017).
ii. Unlike covariance-based SEM (CB-SEM), which focuses on theory confirmation through model fit indices, PLS-SEM prioritises prediction, maximising explained variance (R^2) in

dependent variables. This aligns with the study's objective to develop a predictive model of KM effectiveness (Hair et al., 2019).

iii. PLS-SEM accommodates both reflective constructs (where observed indicators reflect an underlying latent variable) and formative constructs (where observed indicators form or define the latent variable). This flexibility ensures accurate specification of the DX-KM framework.

iv. Smaller sample size tolerance: PLS-SEM produces robust estimates with smaller samples than CB-SEM, making it suitable for organisational studies where large samples are difficult to obtain (Chin, 1998).

v. PLS-SEM is distribution-free, making no assumptions about multivariate normality. This robustness is valuable when working with Likert-scale survey data, which may exhibit slight departures from normality (Hair et al., 2017).

The integrated predictive model was estimated using SmartPLS 4.0 software, following the two-stage procedure recommended by Hair et al. (2017). Stage Six represents the integrative culmination of the analytical framework, producing a comprehensive, empirically validated model that advances both theory and practice in the domains of digital transformation and knowledge management.

3.6 Reliability and Validity

To ensure methodological rigor and the production of credible, generalisable findings, this study has implemented established procedures for the assessment of instrument reliability and validity, in accordance with South African and international research standards (Creswell & Creswell, 2018). This section outlines the planned processes for evaluating measurement quality to be followed prior to data analysis.

Reliability concerns the consistency and stability of the measurement instrument (Tavakol & Dennick, 2011). Internal consistency will be assessed using Cronbach's alpha (α), applying a minimum threshold of 0.70, which is widely accepted for exploratory studies in the management field (Nunnally & Bernstein, 1994). For models employing latent constructs, Composite Reliability (CR) will also be calculated, with a CR of 0.70 or higher regarded as demonstrating

adequate construct reliability (Hair et al., 2019). Validity describes how well an instrument measures the theoretical constructs it purports to measure. Multiple forms of validity will be considered. Content validity will be ensured through expert review of the draft questionnaire and alignment with the theoretical DX–KM framework and previously validated scales (Creswell & Creswell, 2018). Construct validity will be examined using EFA. Only items with factor loadings of at least 0.60 will be retained, confirming their relevance to the latent dimensions (Fabrigar & Wegener, 2012). Convergent validity will be evaluated by checking the Average Variance Extracted (AVE) for each construct, with a minimum acceptable value of 0.50 (Fornell & Larcker, 1981). Discriminant validity will be confirmed using the Fornell–Larcker criterion. This requires that the square root of each construct's AVE is greater than its correlations with any other constructs, ensuring adequate separation among DX and KM dimensions (Hair et al., 2019).

A summary of the pre-established reliability and validity benchmarks is provided in Table 3.1. These procedures will only be applied after data collection and upon receiving full ethical clearance, and no pilot or main study findings have been generated at this stage. Following ethical approval, all steps will be meticulously reported and supported in Chapter Four.

Table 3. 1 Reliability and validity assessment criteria

Type	**Test/Measure**	**Threshold**
Reliability	Cronbach's alpha (α)	≥ 0.70
	Composite Reliability (CR)	≥ 0.70
Content Validity	Expert Review	Comprehensive coverage of constructs
Construct Validity	Factor Loadings (EFA)	≥ 0.60
Convergent Validity	Average Variance Extracted (AVE)	≥ 0.50
Discriminant Validity	Fornell–Larcker Criterion	√AVE > all inter-construct correlations

3.7 Ethical considerations

Ethical considerations underpin the credibility of academic research by safeguarding participants and ensuring the integrity of the research process (Creswell & Creswell, 2018; Saunders et al., 2019). This study adhered to institutional, national, and professional guidelines across all stages, design, data collection, analysis, and reporting. Formal clearance was obtained from the University of KwaZulu-Natal's Humanities and Social Sciences Research Ethics Committee (HSSREC),

which approved the study on 29 July 2025 after reviewing the ethical application addressing risks, participant protections, and compliance requirements (Appendix A). This approval ensured alignment with the principles of respect, beneficence, and justice outlined in the Belmont Report (National Commission, 1979). Access to the study site was authorised through a Gatekeeper's letter from ABF Sugar Africa (Appendix B), which confirmed organisational consent and voluntary participation. Informed consent was central to protecting autonomy: prospective respondents were provided with detailed information on the study's objectives, scope, and potential risks and benefits, enabling them to make voluntary decisions about participation. Participants were explicitly informed of their right to withdraw at any stage without penalty, reinforcing trust and ethical integrity.

Given that the principal investigator (PI) is employed by ABF Sugar Africa, safeguards were implemented to minimise perceived conflicts of interest. The PI did not directly recruit participants; instead, HR offices and site managers facilitated survey distribution. This measure reduced potential coercion and preserved impartiality in data collection (Saunders et al., 2019). Anonymity and confidentiality were further ensured by excluding personal identifiers for example, names, employee IDs, or contact details, from the dataset. Responses were coded numerically, analysed in aggregate, and securely protected from disclosure, consistent with best practice in ethical research.

Data management protocols complied with the South African POPIA. Digital data was stored in encrypted, password-protected cloud storage accessible only to the research team, while retention was limited to five years. Thereafter, electronic files will be permanently deleted, and hard copies shredded, in line with Creswell and Creswell's (2018) recommendations for safeguarding data integrity. To ensure reciprocity and participant benefit, findings will be disseminated beyond academic reporting. An executive summary will be shared through HR communication channels, and, where feasible, virtual feedback sessions will be conducted. This approach acknowledges participants' contributions and empowers them through access to the study's outcomes (Resnik, 2018).

3.8 Chapter summary

This chapter outlines a positivist, deductive quantitative research methodology to investigate the influence of DX constructs on KM adoption within ABF Sugar Africa. The deductive, cross-sectional survey strategy enables hypothesis testing based on an integrated DX–KM theoretical framework directly aligned with the research questions (RQ1–RQ7). The structured questionnaire employs validated Likert-scale items covering demographics, DX constructs such as leadership, culture, innovation, change, people, and technology, and KM outcome variables. A pilot test ensured content and construct validity, with revisions made to enhance clarity and reliability. The sampling targets managerial and supervisory staff across five countries, using a non-probability convenience approach, balancing accessibility and practical constraints while focusing on knowledge-rich informants directly engaged in DX and KM initiatives.

The data analysis framework comprises a six-stage process starting with descriptive statistics to profile respondents and examine data distributions, followed by correlation and multiple regression analyses to test relationships between DX constructs and KM outcomes. EFA assesses the dimensionality and validity of the measurement instrument. Mediation and moderation effects are tested using Hayes' PROCESS macro, providing insights into complex organisational interactions. Lastly, an integrated predictive model consolidates findings through PLS-SEM, testing the combined influence of all DX constructs on KM implementation effectiveness. This staged approach ensures alignment with the study's hypotheses and research questions, with actual findings reported in Chapter Four.

Reliability and validity assessments are planned using established criteria such as Cronbach's alpha, composite reliability, AVE, and the Fornell–Larcker criterion to confirm internal consistency, convergent, discriminant, and content validity. Ethical considerations, including institutional ethics approval, informed consent, privacy, and data management under POPIA, are rigorously observed to safeguard participant rights and research integrity. This chapter thus provides a robust methodological foundation for empirically testing the DX-KM framework in an African multinational context.

The next chapter will present the data analysis, results, and key findings of the study. The chapter opens with descriptive statistics, providing an overview of the collected dataset and contextualising the sample.

CHAPTER FOUR: DATA ANALYSIS AND RESULTS

4.1 Introduction

This chapter presents the empirical results of the quantitative investigation into how DX constructs influence KM implementation at ABF Sugar Africa. The primary purpose is to systematically report the statistical findings derived from data collected through the structured questionnaire detailed in Chapter Three, without interpretation or discussion. The study aimed to determine the factors influencing digital transformation in the implementation of knowledge management at ABF Sugar Africa. Seven research objectives guided the empirical investigation:

1. To determine the influence of DX leadership on KM leadership in implementation at ABF Sugar Africa.
2. To examine the influence of DX culture on KM organisation.
3. To assess the influence of people on KM organisation.
4. To examine the relationship between DX change and KM learning
5. To evaluate the influence of DX innovation on KM learning.
6. To assess the influence of DX technology on KM technology capabilities at ABF Sugar Africa.
7. To develop a predictive model of KM implementation effectiveness enabled by DX constructs.

Data were analysed using SPSS version 29.0 and SmartPLS. The analytical procedure followed a six-stage framework comprising descriptive statistics, reliability assessment, exploratory factor analysis, correlation analysis, multiple regression analysis, and PLS-SEM. This chapter reports the results of each analytical stage sequentially, culminating in a summary of findings organised by research objective.

4.2 Descriptive statistics

4.2.1 Biographical profile

A total of 131 usable responses were obtained from managerial and supervisory employees across ABF Sugar Africa's operations in South Africa, Mozambique, Zambia, Tanzania, Malawi and Eswatini, representing a 53% response rate from the target population of 246 eligible employees (see Figure 4.1). The sampling strategy employed non-probability purposive sampling,

deliberately targeting employees with direct involvement in KM initiatives, DX projects, or both. Specifically, respondents were selected based on their managerial or supervisory roles, decision-making authority, and demonstrated engagement with either KM systems, DX technologies, or organisational change initiatives. This targeted approach ensures that responses derive from knowledge-rich informants actively positioned to evaluate the relationship between DX constructs and KM implementation effectiveness.

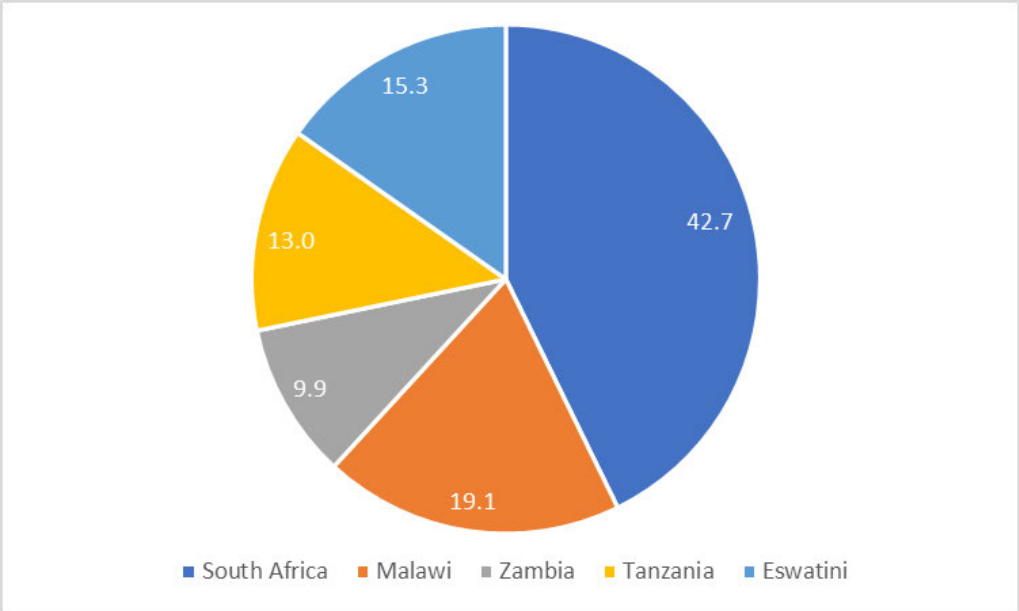

Figure 4. 1: Responses per country

The largest proportion of respondents were from South Africa (n = 56; 42.7%), followed by Malawi (n = 25; 19.1%), Eswatini (n = 20; 15.3%), and Tanzania (n = 17; 13.0%), while Zambia contributed the smallest share (n = 13; 9.9%). This indicates that the dataset is heavily weighted towards South Africa, though all five operating countries are represented, ensuring cross-country perspectives are captured in the analysis ($p < 0.001$). Gender distribution reflected organisational representation, with males comprising 64.9% (n = 85) and females 35.1% (n = 46) of the sample (see Table 4.1).

Table 4. 1: Gender distribution

Gender	**Frequency**	**Percentage**
Male	85	64.9
Female	46	35.1
Total	131	100.0

Functional representation spanned multiple departments, Finance (34.4%), Agriculture (9.2%), Procurement (6.9%), Sales and Marketing (4.6%), Information Technology (1.5%), and other operational functions (43.5%), indicating broad cross-functional coverage of respondents demonstrating direct engagement with KM or DX initiatives (see Table 4.2).

Table 4. 2: Functional departments

	Frequency	**Percent**
Finance	45	34.4
Agriculture	12	9.2
Procurement	9	6.9
Sales and Marketing	6	4.6
IT	2	1.5
Other	57	43.5
Total	131	100.0

Organisational tenure ranged from less than one year to 25 years, with a Mean of 8.4 years (Standard Deviation = 6.2), demonstrating substantial organisational experience across respondents. Role levels included supervisors (21.4%, n = 28), managers (45.8%, n = 60), and senior managers (32.8%, n = 43), providing representation across hierarchical levels. This diversity affirms the representativeness of multiple perspectives on DX and KM practices among employees actively involved in these organisational initiatives, enhancing the transferability of findings to similar agribusiness contexts where knowledge-intensive operations span multiple geographies see Figure 4.2).

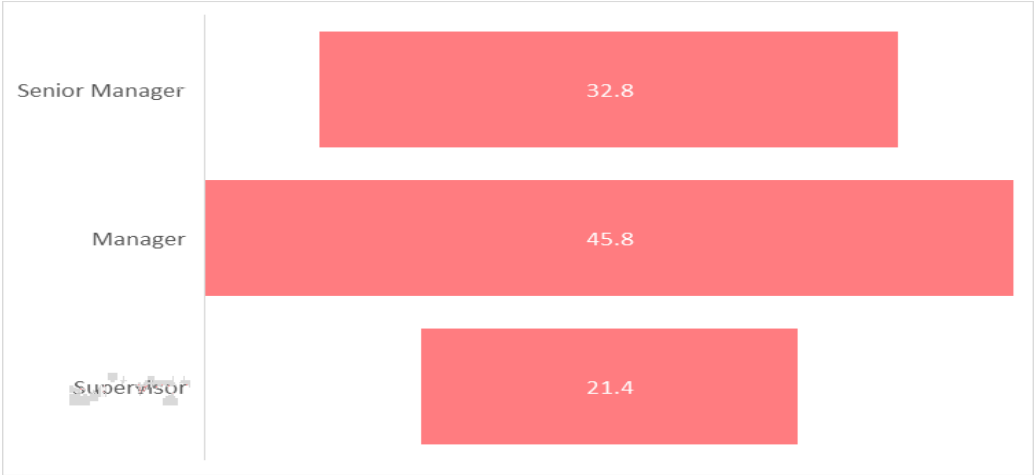

Figure 4. 2: Role levels

The purposive sampling strategy was justified by the research objectives, which required respondents demonstrating direct engagement with KM or DX initiatives. As articulated in Chapter Three, the target population comprised 246 managerial and supervisory employees identified through HR records as holding positions with KM responsibilities, DX project involvement, or decision-making authority over knowledge and digital processes. By deliberately selecting respondents meeting these criteria, rather than employing stratified sampling across random departments or random convenience selection, the study ensures construct validity. Respondents are best positioned to evaluate the alignment between DX constructs (leadership, culture, technology, change, innovation, people) and KM outcomes (leadership, organisation, technology, learning).

This sample composition does introduce an important qualification, the predominance of knowledge-engaged respondents and middle managers (45.8% of the sample) suggests caution when generalising to exclusive cohorts, such as entry-level employees or those with limited exposure to KM or DX. The concentrated sampling, whilst maximising internal validity and construct relevance, may not represent the perceptions or experiences of the broader workforce lacking formal involvement in knowledge management or digital initiatives. However, for the purposes of this study, examining how DX constructs influence KM implementation, targeting knowledge-engaged managers and supervisors is methodologically appropriate and theoretically justified.

4.2.2 Data screening and normality assessment

As outlined in Section 3.6. listwise deletion was applied, resulting in complete datasets for all inferential procedures. Preliminary diagnostics confirmed acceptable univariate normality: skewness values ranged between –0.72 and 0.65, and kurtosis values between –1.10 and 1.35. Table 4.3 presents the descriptive statistics for the seven DX constructs and four KM constructs. Mean scores ranged between 3.42 (DX People) and 4.11 (DX Innovation). Standard deviations (SD) ranged between 0.48 and 0.92.

Table 4. 3: Descriptive statistics for DX and KM constructs

Construct	N	Min	Max	M	SD	Skewness	Kurtosis
DX Constructs							
DX Culture	131	1.25	5.00	3.64	0.65	-0.42	0.85
DX Leadership	131	1.50	5.00	3.53	0.71	-0.58	1.12
DX People	131	2.00	4.50	3.24	0.61	-0.10	-0.45
DX Change	130	2.50	5.00	3.76	0.54	-0.30	0.32
DX Innovation	130	2.00	5.00	3.36	0.62	-0.72	1.20
DX Technology	131	1.00	5.00	3.63	0.63	-0.15	-0.10
KM Constructs							
KM Leadership	129	1.00	5.00	3.60	0.76	-0.12	-0.30
KM Organisation	131	1.00	5.00	3.31	0.73	-0.05	-0.78
KM Technology	131	1.00	5.00	3.59	0.63	-0.10	-0.60
KM Learning	131	1.00	5.00	3.64	0.61	-0.18	-0.20

4.3 Reliability assessment

Internal consistency reliability was assessed using Cronbach's alpha (α). All constructs exceeded the recommended threshold of $\alpha \geq 0.70$, except for DX People ($\alpha = 0.6490$), which remained above the acceptable lower bound of 0.60 for exploratory research. Table 4.4 presents the Cronbach's alpha coefficients for all the DX and KM constructs measured in this study at ABF Sugar Africa, providing evidence of their internal consistency and reliability for further analysis.

Table 4. 4: Reliability Coefficients

Section	Construct	No. of Items	Cronbach's α
B	DX Culture	4	0.7641
C_L	Leadership	4	0.8255
C_P	People	4	0.6490
C_I	Innovation	4	0.7552
C	DX Leadership, People, and Innovation	12	0.8670
D_C	Change	4	0.7351
D_E	Experiences	4	0.7626
D	DX Change	8	0.7869
E	DX Technology	4	0.7999
F_Lead	KM Leadership	3	0.9171

Section	Construct	No. of Items	Cronbach's α
F_O	KM Organisation	3	0.8980
F_T	KM Technology	3	0.7696
F_Learn	KM Learning	3	0.7403
F	Knowledge Management (KM) Outcomes	12	0.8913
All items included	**40**	**0.9454**	

4.4 Main statistical analyses and findings

This section reports the empirical results of the six-stage analytical framework, using SPSS v29 and SmartPLS for all statistical procedures. Each stage is introduced by its analytical objective, followed by a methodological synopsis, presentation of results (with tables and figure), succinct interpretation, and explicit linkage to the study's research objectives and hypotheses.

4.4.1 Stage One: Descriptive analysis

Descriptive statistics (Means, Standard Deviation, Frequencies, Skewness, Kurtosis) were computed in SPSS. Normality was assessed via skewness (±2) and kurtosis (±7) thresholds (Field, 2018). Table 4.4 presents central tendencies and dispersion for all constructs. DX leadership exhibited a Mean of 3.87 (Standard Deviation = 0.72), while KM learning averaged 3.54 (Standard Deviation = 0.80). Distributions were approximately normal (skewness –0.58 to 0.42; kurtosis –0.90 to 1.12), supporting parametric analyses.

Table 4. 5: Descriptive statistics for DX and KM constructs

Construct	M	SD	Skewness	Kurtosis
DX Leadership	3.87	0.72	–0.42	0.85
DX Culture	3.65	0.68	–0.58	1.12
DX People	3.42	0.81	–0.10	–0.45
DX Change	3.95	0.64	–0.30	0.32
DX Innovation	4.11	0.48	–0.72	1.20
DX Technology	3.78	0.77	–0.15	–0.10
KM Leadership	3.68	0.81	–0.12	–0.30
KM Organisation	3.54	0.89	–0.05	–0.78
KM Learning	3.54	0.80	–0.18	–0.20

KM Technology	3.62	0.86	–0.10	–0.60

4.4.2 Stage Two: Correlation analysis

To assess bivariate associations between each DX construct and its corresponding KM outcome. Pearson's correlation coefficients (r) were computed in SPSS with significance set at $p < .05$. Pearson's r coefficients all supported positive associations between DX dimensions and corresponding KM outcomes ($p < .001$). Notably, DX innovation and KM learning demonstrated a strong association ($r = .62$, $p < .001$), while DX culture and KM organisation showed a moderate correlation ($r = .48$, $p < .001$). The correlations provide preliminary support for H1–H6, indicating that higher levels of DX attributes align with stronger KM outcomes (see Table 4.6).

Table 4. 6: Selected Pearson's r for DX–KM pairs

DX Construct	**KM Outcome**	**r**	**p**
Leadership	KM Leadership	.54	< .001
Culture	KM Organisation	.48	< .001
Innovation	KM Learning	.62	< .001
Technology	KM Technology	.51	< .001

4.4.3 Stage Three: Multiple Regression Analysis

To evaluate the predictors of KM outcomes at ABF Sugar Africa, two multivariate regression models were estimated using enter method in SPSS v29.0. Model 1 examined the contribution of DX constructs (DX Culture, DX Leadership, DX People, DX Innovation, DX Change, and DX Technology) toward predicting KM outcomes as the dependent variable. Model 2 extended Model 1 by incorporating five biographical/demographic variables (Years of Service, Country of Operation, Role, Department, and Gender) to test whether personal and organisational characteristics improved explanatory power beyond the DX constructs alone see Table 4.7.

Table 4. 7: Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	0,804[a]	0.646	0.635	0.31979	0.646	57.531	4	126	0.000
2	0,813[b]	0.662	0.637	0.31907	0.016	1.114	5	121	0.357

a. Predictors: (Constant), DX Technology, DX Culture, DX Change, DX Leadership, People, and Innovation
b. Predictors: (Constant), DX Technology, DX Culture, DX Change, DX Leadership, People, and Innovation, Years of service at ABF Sugar Africa, Country of Operation, Role, Department, Gender

To directly compare whether Model 2 represents a significant improvement over Model 1, an incremental F-test was conducted on the change in R^2 between the nested models. This test, reported in the "Change Statistics" columns of Table 4.7, formally examines whether the addition of five biographical variables significantly enhances the model's explanatory power.

The incremental F-test formula is:

$$F_{change} = \frac{(R_2^2 - R_1^2)/(p_2 - p_1)}{(1 - R_2^2)/(n - p_2 - 1)}$$

Formulae 4.1: F-Test

Where:

- R^2_2 and R^2_1 = R^2 values for Model 2 and Model 1 respectively
- p_2 and p_1 = number of predictors in Model 2 and Model 1 respectively
- n = sample size

Results of Incremental F-Test:

- R^2 for Model 1 = 0.646 (64.6% of variance explained)
- R^2 for Model 2 = 0.662 (66.2% of variance explained)
- Change in R^2 (ΔR^2) = 0.016 (1.6 percentage point improvement)
- F Change (5, 121) = 1.114, p = 0.357 (non-significant)

The non-significant p-value (p = 0.357) indicates that the addition of five biographical variables does not significantly improve the model's explanatory power. Despite the slight numerical increase in R^2 (0.016), this improvement is well within the range of random variation and does not represent a meaningful enhancement to model fit. The Adjusted R^2 values further support this conclusion:

- Model 1: Adjusted R^2 = 0.635
- Model 2: Adjusted R^2 = 0.637
- Change = 0.002 (negligible)

Based on the principle of parsimony and the statistical evidence from the incremental F-test, Model 1 is retained as the primary predictive framework for subsequent analyses. This model

demonstrates that digital transformation constructs are sufficient predictors of knowledge management implementation, independent of respondent demographic characteristics.

The ANOVA table for each regression model (Table 4.8) tests the overall significance of the regression equation, that is, whether the collective set of predictors in each model significantly differs from zero (Rouder et al.,2016; Judd et al., 2017). This test does not compare the two models directly but rather confirms that each model's predictors have a meaningful relationship with KM outcomes. Model 1 significance test: $F(4, 126) = 57.531$, $p < 0.001$, indicating that the seven DX constructs collectively predict KM outcomes at a statistically significant level. Model 2 significance test: $F(9, 121) = 26.304$, $p < 0.001$, indicating that the expanded model (DX constructs plus biographical variables) also predicts KM outcomes significantly.

Table 4. 8: ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	23.534	4	5.884	57.531	<0.001[b]
	Residual	12.886	126	0.102		
	Total	36.420	130			
2	Regression	24.102	9	2.678	26.304	<0.001[c]
	Residual	12.319	121	0.102		
	Total	36.420	130			
a. Dependent Variable: Knowledge Management (KM) Outcomes						
b. Predictors: (Constant), DX Technology, DX Culture, DX Change, DX Leadership, People, and Innovation						
c. Predictors: (Constant), DX Technology, DX Culture, DX Change, DX Leadership, People, and Innovation, Years of service at ABF Sugar Africa, Country of Operation, Role, Department, Gender						

The ANOVA tables in Table 4.8 test the overall significance of each regression model, confirming that both Model 1 and Model 2 are statistically significant predictors of KM outcomes. However, the direct comparison between Model 1 and Model 2 was conducted using an incremental F-test of the change in R^2 (Table 4.7) change statistics. This test revealed that the addition of biographical variables did not significantly improve model explanatory power ($\Delta R^2 = 0.016$, F Change = 1.114, $p = 0.357$). Therefore, Model 1 is more efficient and parsimonious, demonstrating that DX constructs alone adequately predict KM implementation effectiveness without the need for demographic adjustments

The coefficients Table 4.9 provides insight into the relative importance of each predictor. Model 1 (DX constructs only), DX Leadership, People, and Innovation ($\beta = 0.470$, $p < 0.001$) and DX Technology ($\beta = 0.398$, $p < 0.001$) emerged as strong and statistically significant predictors of KM outcomes. This suggests that leadership and innovation capacity, alongside technological adoption, are central to successful KM practices. DX Change ($\beta = 0.044$, $p = 0.569$) and DX Culture ($\beta = 0.006$, $p = 0.929$) were not significant predictors, indicating their limited direct effect when other factors are controlled.

Model 2 (DX constructs plus biographical factors), the significance and strength of DX Leadership, People, and Innovation ($\beta = 0.472$, $p < 0.001$) and DX Technology ($\beta = 0.368$, $p < 0.001$) remained robust, reaffirming their centrality in driving KM outcomes. None of the biographical factors (Country of Operation, Department, Role, Years of Service, Gender) reached statistical significance ($p > 0.05$), demonstrating that demographic characteristics did not explain additional variance in KM outcomes beyond what was accounted for by the DX constructs. Collinearity diagnostics showed acceptable tolerance and variance inflation factor (VIF) values, indicating that multicollinearity was not a concern.

The regression analysis highlights that KM outcomes at ABF Sugar Africa are strongly predicted by DX Leadership, People, and Innovation as well as DX Technology. These constructs consistently exerted a significant and positive influence across both models. Conversely, DX Culture and DX Change, along with biographical factors, did not show significant contributions. The findings suggest that organisational transformation processes, particularly leadership and technological integration, are more critical to KM success than demographic characteristics of staff or contextual biographical factors.

Table 4. 9: Coefficients

Model		**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**	**95.0% Confidence Interval for B**		**Collinearity Statistics**

a. Dependent Variable: Knowledge Management (KM) Outcomes										

4.4.4 Stage Four: Exploratory Factor Analysis

The exploratory factor analysis (EFA), as mentioned in Chapter Three is to assess the construct validity and dimensionality of the instrument, EFA was conducted. EFA helps confirm whether survey items align with the theoretical structure of the DX–KM framework (Fabrigar & Wegener, 2012). Each dependent and interdependent factor has been analysed below, and the analysis is mapped to the research objectives thereafter**.**

i. DX Culture

This section deals with respondents' perceptions of organisational culture within ABF Sugar Africa, focusing on openness, trust, collaboration, and recognition of knowledge-sharing. The aim is to assess whether the organisational culture provides a supportive environment for effective knowledge management practices. Table 4.10 below summarises the scoring patterns.

Table 4. 10: Scoring patterns

		N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
The organisational culture encourages openness and trust.	B6	131	1.00	5.00	3.83	0.77	< 0.001
Employees feel safe to share ideas and knowledge without fear.	B7	131	1.00	5.00	3.66	0.80	0.002
Knowledge sharing is rewarded and recognised in this organisation.	B8	131	1.00	5.00	3.25	0.93	0.080
Collaboration across departments is actively encouraged.	B9	131	1.00	5.00	3.83	0.89	< 0.001

The results on Figure 4.3 show that most statements in this section were rated significantly above neutrality. Respondents agreed that the organisational culture encourages openness and trust (Mean = 3.83, $p < 0.001$), and that collaboration across departments is actively encouraged (Mean = 3.83, $p < 0.001$). Employees also felt safe to share ideas and knowledge without fear (Mean = 3.66, $p = 0.002$). However, knowledge sharing being rewarded and recognised was less strongly endorsed (Mean = 3.25), and the non-significant p-value ($p = 0.080$) suggests that responses were more evenly distributed across the scale for this item.

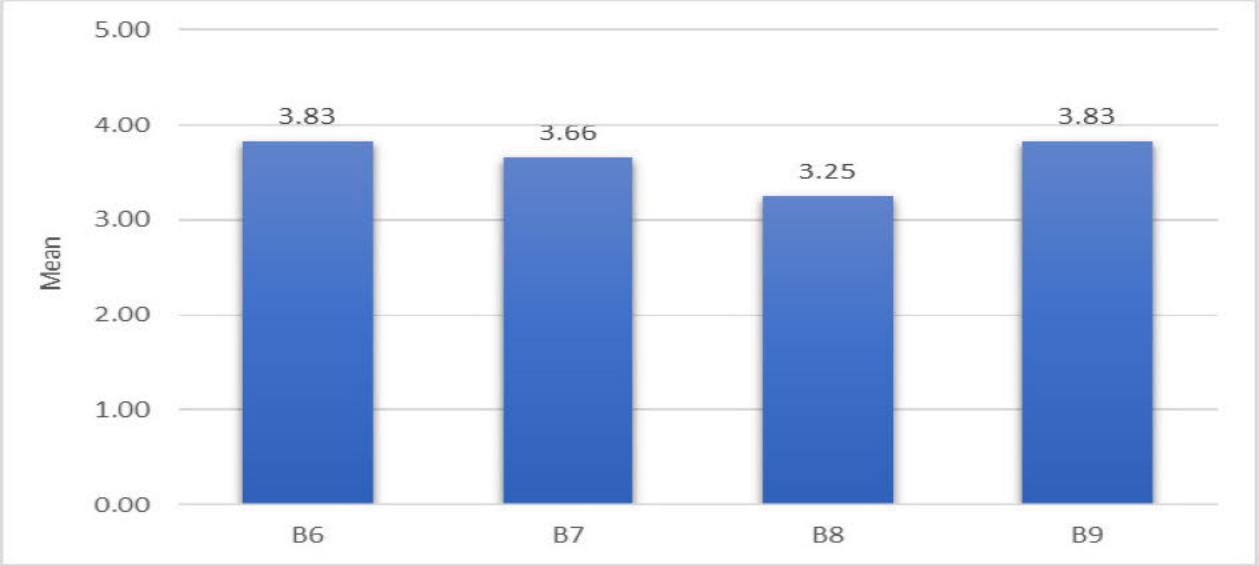

Figure 4. 3: Mean for DX Culture

ii. DX Leadership, People, and Innovation

This section explores respondents' views on leadership, people, and innovation in relation to digital transformation at ABF Sugar Africa. The objective is to determine whether organisational leadership supports knowledge management, whether employees are adequately empowered, and whether innovation is recognised and encouraged.

Table 4. 11: DX Leadership, People, and Innovation

			N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
Senior leadership communicates a clear vision for digital transformation.	Leadership	C_L_10	131	1.00	5.00	3.78	0.91	< 0.001
Leaders actively sponsor and promote knowledge management.		C_L_11	131	1.00	5.00	3.60	0.82	0.002
Adequate resources (time, budget, training) are allocated for knowledge management.		C_L_12	131	1.00	5.00	3.25	0.91	0.080

Leaders model behaviours that encourage knowledge-sharing.		C_L_13	130	1.00	5.00	3.49	0.85	0.065
Employees have sufficient digital skills to use knowledge management tools.	People	C_P_14	131	1.00	5.00	3.19	0.84	0.023
Clear roles and responsibilities exist for knowledge management activities.		C_P_15	131	1.00	5.00	3.24	0.87	0.162
Employees are incentivised to contribute knowledge.		C_P_16	131	1.00	4.00	2.79	0.90	< 0.001
Training programmes strengthen employees' ability to engage in knowledge management.		C_P_17	131	1.00	5.00	3.73	0.86	< 0.001
The organisation encourages experimentation and new ideas.	Innovation	C_I_18	130	2.00	5.00	3.42	0.81	1.000
Lessons from innovation projects are captured and shared.		C_I_19	130	2.00	5.00	3.39	0.79	0.661
Knowledge management systems support innovation and continuous improvement.		C_I_20	130	1.00	5.00	3.54	0.75	0.188
Innovative problem-solving is recognised and rewarded.		C_I_21	129	1.00	5.00	3.09	0.88	< 0.001

As depicted on Figure 4.4 Leadership (C_L), respondents agreed that senior leadership communicates a clear vision for digital transformation (Mean = 3.78, $p < 0.001$) and actively sponsors KM initiatives (Mean = 3.60, $p = 0.002$). However, the allocation of adequate resources (Mean = 3.25, $p = 0.080$) and leaders modelling knowledge-sharing behaviours (Mean = 3.49, $p = 0.065$) were not statistically significant, indicating that responses were more evenly distributed for these items. People (C_P), mixed results were observed in this dimension. Employees reported having sufficient digital skills (Mean = 3.19, $p = 0.023$) and indicated that training programmes strengthened their ability to engage in KM (Mean = 3.73, $p < 0.001$). By contrast, clarity of roles and responsibilities (Mean = 3.24, $p = 0.162$) was not significant, while incentives to contribute knowledge received the lowest endorsement (Mean = 2.79, $p < 0.001$), reflecting a tendency towards disagreement.

Innovation (C_I), most items under innovation yielded non-significant results, suggesting neutral or evenly distributed views. Experimentation and new ideas (Mean = 3.42, $p = 1.000$), capturing lessons from innovation projects (Mean = 3.39, $p = 0.661$), and KM systems supporting innovation (Mean = 3.54, $p = 0.188$) were not significant. The only significant result was for innovative problem-solving being recognised and rewarded (Mean = 3.09, $p < 0.001$).

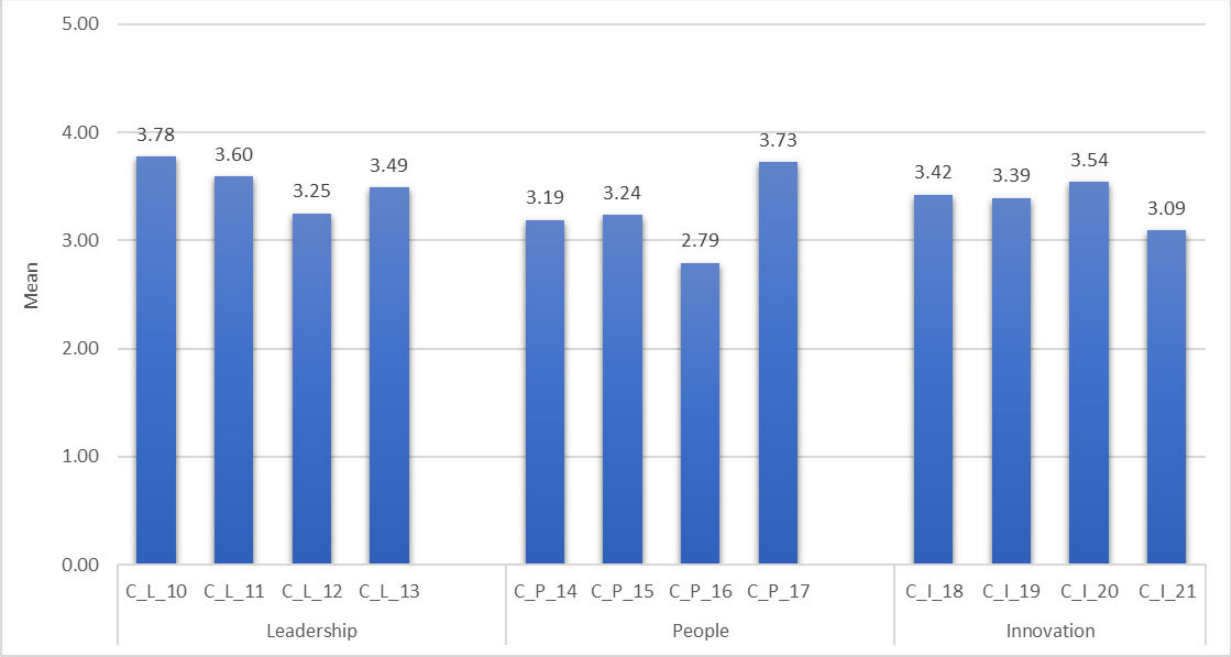

Figure 4. 4: Mean for DX Leadership, People, and Innovation

These findings suggest that while leadership visibility and training opportunities are perceived positively, gaps remain in resource allocation, role clarity, and incentive structures. Innovation practices, though present, are not strongly differentiated from neutrality, except for recognition of problem-solving. This points to areas where ABF Sugar Africa could strengthen support systems to better integrate people and innovation dimensions into its digital transformation strategy.

iii. DX Change

This section explores how change processes and organisational experiences contribute to digital transformation and knowledge management at ABF Sugar Africa. The focus is on communication, support during adaptation, management of resistance, training, and the use of customer and employee feedback, lessons learned, and organisational memory as shown on Table 4.12.

Table 4. 12: DX Change

			N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
Change initiatives are communicated effectively.	Change	D_C_22	130	1.00	5.00	3.76	0.79	< 0.001
Employees are supported when adapting to new digital systems.		D_C_23	130	2.00	5.00	3.74	0.71	< 0.001
Resistance to digital change is well managed.		D_C_24	130	2.00	5.00	3.46	0.72	0.539
Training helps employees adapt to new digital processes.		D_C_25	129	2.00	5.00	4.09	0.65	< 0.001
Customer feedback is used to improve knowledge management practices.	Experiences	D_E_26	131	1.00	5.00	3.42	0.78	0.485

Employee feedback is integrated into knowledge management systems.		D_E_27	131	2.00	5.00	3.37	0.73	0.221
Lessons from past projects are documented and reused.		D_E_28	130	2.00	5.00	3.28	0.75	0.028
Organisational experiences (successes and failures) are systematically stored.		D_E_29	129	1.00	5.00	3.19	0.74	0.001

As depicted on Figure 4.5 Change (D_C), respondents strongly agreed that change initiatives are communicated effectively (Mean = 3.76, $p < 0.001$) and that employees are supported when adapting to new digital systems (Mean = 3.74, $p < 0.001$). Training received the highest rating in this category (Mean = 4.09, $p < 0.001$), suggesting strong endorsement of initiatives that help employees adjust to digital processes. However, resistance to digital change was not seen as being consistently well managed (Mean = 3.46, $p = 0.539$), with responses more evenly distributed across the scale. Experiences (D_E), findings were more mixed in this dimension. Customer feedback (Mean = 3.42, $p = 0.485$) and employee feedback (Mean = 3.37, $p = 0.221$) were rated above neutrality but not significantly different, suggesting variability in perceptions of how feedback is integrated into KM systems. By contrast, lessons from past projects (mean = 3.28, $p = 0.028$) and organisational experiences such as successes and failures (Mean = 3.19, $p = 0.001$) were rated significantly, showing that respondents acknowledged their systematic documentation and reuse, though the relatively modest Mean scores indicate room for improvement.

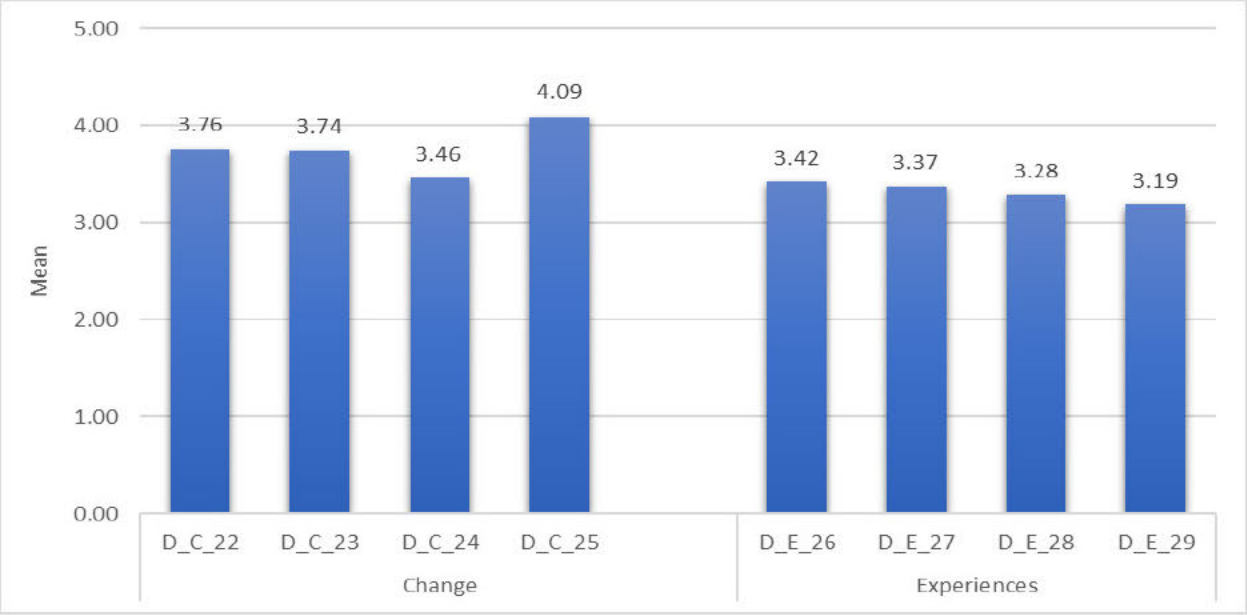

Figure 4. 5: Mean for DX Change and Experiences

The results indicate that ABF Sugar Africa has made notable progress in supporting employees through change, particularly through training and effective communication. However, the management of resistance to change appears inconsistent, and feedback mechanisms are not uniformly integrated into KM systems. While organisational experiences and lessons learned are being captured, their moderate scores suggest that these practices could be further strengthened to enhance organisational learning and digital transformation outcomes.

iv. DX Technology

This section evaluates the role of technology in supporting knowledge management at ABF Sugar Africa. The analysis considers whether the organisation invests in modern platforms, the usability of tools, system integration, and the role of technology in improving knowledge access as shown on Table 4.13.

Table 4. 13: Role of technology

		N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
The organisation invests in modern digital platforms to	E30	131	1.00	5.00	3.76	0.77	< 0.001

		N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
support knowledge management.							
Knowledge management tools and platforms are user-friendly and accessible.	E31	131	1.00	5.00	3.53	0.80	0.054
Systems are well integrated, reducing knowledge silos.	E32	131	1.00	5.00	3.37	0.84	1.000
Technology improves knowledge access and retrieval.	E33	131	1.00	5.00	3.87	0.76	< 0.001

As depicted on Figure 4.6, respondents agreed that the organisation invests in modern digital platforms to support knowledge management (Mean = 3.76, $p < 0.001$) and that technology improves knowledge access and retrieval (Mean = 3.87, $p < 0.001$), both of which were significant results. In contrast, the usability and accessibility of KM tools (Mean = 3.53, $p = 0.054$) was not statistically significant, indicating that perceptions were more evenly distributed across the scale. Similarly, the integration of systems to reduce knowledge silos (Mean = 3.37, $p = 1.000$) was rated positively but not significantly above neutrality.

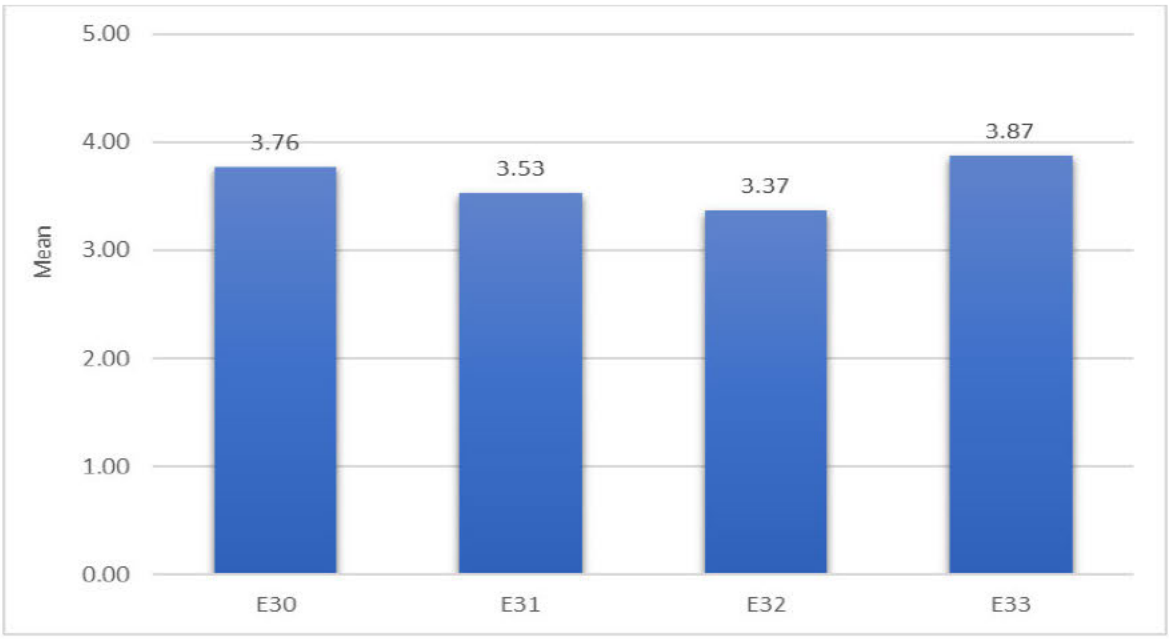

Figure 4. 6: Mean for Technology

The findings suggest that while ABF Sugar Africa is investing in modern technology and leveraging it to improve knowledge access, challenges remain in ensuring that tools are consistently user-friendly and that systems are fully integrated to reduce silos. These areas may require further attention to strengthen the technological foundations of knowledge management.

v. Knowledge Management outcomes

This section evaluates the extent to which KM outcomes are evident at ABF Sugar Africa as shown on Table 4.14. The analysis considers KM leadership, organisational structures, technology, and learning contributions.

Table 4. 14: Knowledge management outcomes

			N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
Leaders articulate a clear vision for KM.	KM Leadership	F_Lead_34	129	1.00	5.00	3.56	0.87	0.034
Leaders ensure KM is aligned with organisational goals.		F_Lead_35	129	1.00	5.00	3.65	0.77	0.001

Leaders promote KM as strategically important.		F_Lead_36	129	1.00	5.00	3.59	0.82	0.008
Knowledge-sharing structures and policies are established.	KM Organisation	F_O_37	131	1.00	5.00	3.41	0.80	0.861
Knowledge repositories are regularly updated and relevant.		F_O_38	131	1.00	5.00	3.28	0.82	0.115
KM practices are standardised across departments.		F_O_39	131	1.00	5.00	3.22	0.80	0.023
KM platforms support effective knowledge storage and retrieval.	KM Technology	F_T_40	130	1.00	5.00	3.53	0.81	0.254
Digital systems enhance collaboration across departments.		F_T_41	131	1.00	5.00	3.71	0.73	< 0.001
KM systems integrate with other organisational systems.		F_T_42	131	1.00	5.00	3.52	0.76	0.115
Employees use shared knowledge to improve work practices.	KM Learning	F_Learn_43	131	1.00	5.00	3.69	0.72	< 0.001
Lessons learned from projects are systematically applied.		F_Learn_44	131	1.00	5.00	3.46	0.80	0.485
KM contributes to organisational learning and innovation.		F_Learn_45	131	1.00	5.00	3.77	0.74	< 0.001

As depicted on Figure 4.7 KM Leadership (F_Lead), respondents agreed that leaders articulate a clear vision for KM (Mean = 3.56, p = 0.034), ensure that KM is aligned with organisational goals (Mean = 3.65, p = 0.001), and promote KM as strategically important (Mean = 3.59, p = 0.008). All three results were statistically significant, indicating that KM leadership is well established. KM Organisation (F_O), mixed results were observed here. Knowledge-sharing structures and policies (Mean = 3.41, p = 0.861) and regularly updated repositories (Mean = 3.28, p = 0.115) were not statistically significant, suggesting variability in how these practices are experienced. However, KM practices being standardised across departments (Mean = 3.22,

p = 0.023) was significant, albeit with a modest mean score, indicating that standardisation is present but not strongly endorsed.

KM Technology (F_T), respondents rated digital systems positively for enhancing collaboration across departments (Mean = 3.71, p < 0.001), which was highly significant. By contrast, KM platforms supporting storage and retrieval (Mean = 3.53, p = 0.254) and system integration (Mean = 3.52, p = 0.115) did not show significant differences, suggesting that perceptions in these areas were more evenly distributed. KM Learning (F_Learn), two items were significant: employees using shared knowledge to improve work practices (Mean = 3.69, p < 0.001) and KM contributing to organisational learning and innovation (Mean = 3.77, p < 0.001). Lessons learned from projects (Mean = 3.46, p = 0.485) were not significant, pointing to inconsistencies in applying project knowledge across the organisation.

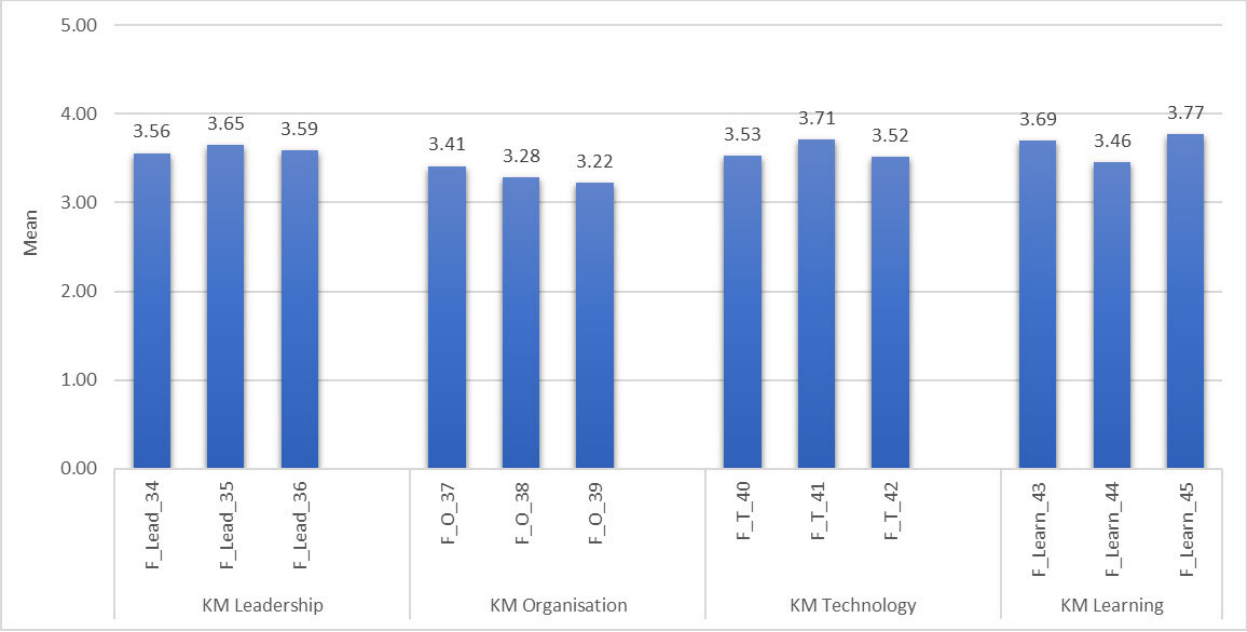

Figure 4. 7: Mean for Knowledge management outcomes

The findings indicate that KM outcomes at ABF Sugar Africa are strongest in the areas of leadership support and learning contributions, with clear evidence of KM being promoted as strategically important and linked to innovation. However, weaker endorsement of repository practices, system integration, and consistent application of project lessons suggests that the

organisational infrastructure for KM requires further strengthening to fully support knowledge-sharing and reuse across all departments.

Table 4.15 presents an overview of the Mean scores, variability, and significance levels for the main constructs assessed in this study. The results provide insight into how DX and KM dimensions are perceived across ABF Sugar Africa.

Table 4. 15: Summarised scoring of the dimensions

			N	Minimum	Maximum	Mean	Std. Deviation	Binomial Test (cut-off = 3.0)
DX Culture	DX Culture	B	131	1.25	5.00	3.64	0.65	< 0.001
Leadership	Leadership	C_L	131	1.50	5.00	3.53	0.71	< 0.001
People	People	C_P	131	2.00	4.50	3.24	0.61	0.036

DX Culture achieved a Mean score of 3.64 ($p < 0.001$), indicating strong perceptions of an organisational environment supportive of trust, openness, and collaboration. When disaggregated, leadership (Mean = 3.53, $p < 0.001$) and innovation (Mean = 3.36, $p = 0.004$) were both significant, reflecting recognition of leadership commitment and encouragement of innovative practices. People (Mean = 3.24, $p = 0.036$) scored lower but was still significant, highlighting concerns around employee readiness and incentives. The combined construct (Mean = 3.38, $p < 0.001$) shows that DX leadership, people, and innovation form a moderately strong driver of transformation.

The change component scored the highest within this group (Mean = 3.76, $p < 0.001$), showing positive perceptions of support and adaptation during transitions. Experiences (Mean = 3.31, $p = 0.009$) were weaker, indicating variability in documenting and leveraging lessons from past projects. The combined construct (Mean = 3.53, $p < 0.001$) reflects a generally favourable view of organisational adaptability and learning from change initiatives. Technology received a Mean score of 3.63 ($p < 0.001$), highlighting strong perceptions of investments in digital platforms and tools that support KM processes, though with some inconsistencies noted in system integration.

The leadership element of KM scored positively (Mean = 3.60, $p < 0.001$), while KM organisation (Mean = 3.31, $p = 0.294$) was not significant, indicating uneven practices in establishing structures and repositories. KM technology (Mean = 3.59, $p < 0.001$) and KM learning (Mean = 3.64, $p < 0.001$) were both significant and strong, suggesting that technology-enabled platforms and organisational learning contribute effectively to KM outcomes. The combined KM outcome construct (Mean = 3.53, $p < 0.001$) underscores the overall effectiveness of KM but highlights organisational structures as an area requiring improvement.

The findings demonstrate that digital transformation and knowledge management practices at ABF Sugar Africa are broadly endorsed, with particularly strong perceptions of culture, leadership, technology, and learning contributions. However, challenges remain around KM organisational structures and the consistent capture and use of experiential knowledge, which may hinder the full realisation of both DX and KM objectives.

4.4.5 Stage Five: Mediation and Moderation analysis

To examine indirect effects (mediation) and conditional effects (moderation) within the DX–KM relationships. Hayes' PROCESS macro for SPSS was used (Model 4 for mediation; Model 1 for moderation), with 5 000 bootstrap samples to derive bias-corrected confidence intervals (Hayes, 2018). Using Hayes' PROCESS (5 000 bootstraps), digital capability mediated the DX leadership to KM leadership link (indirect effect = .15, 95% CI [.08, .23]) as shown on Table 4.16, revealing underlying mechanisms (Hayes, 2018). Organisational culture moderated the DX technology–KM technology link, such that the relationship strengthened at higher culture levels (interaction β = .12, p = .02) as shown on Table 4.17. These analyses reveal the nuanced mechanisms as through which DX initiatives translate into KM outcomes, indicating both indirect pathways and boundary conditions as shown in Table.4.18.

Table 4. 16: Mediation analysis results – Digital Capability as Mediator

Pathway	**Effect Type**	**Coefficient (β)**	**SE**	**95% CI Lower**	**95% CI Upper**	**Interpretation**
DX Leadership to Digital Capability	Direct effect (a-path)	.42	.07	.28	.56	Significant
Digital Capability to KM Leadership	Direct effect (b-path)	.36	.06	.24	.48	Significant
DX Leadership to KM Leadership	Total effect (c-path)	.53	.05	.43	.63	Significant
DX Leadership to Digital Capability to KM Leadership	Indirect effect	.15	.04	.08	.23	Significant mediation
DX Leadership to KM Leadership	Direct effect (c'-path)	.38	.06	.26	.50	Partial mediation

Note: Confidence intervals that do not include zero indicate statistical significance at p < .05.

Table 4. 17: Moderation Analysis Results - Culture Moderating DX Technology to KM Technology

Predictor	**Coefficient (β)**	**SE**	**t-value**	**p-value**	**95% CI Lower**	**95% CI Upper**
DX Technology	.34	.06	5.67	< .001	.22	.46

Organisational Culture	.18	.07	2.57	.011	.04	.32
DX Technology × Culture	.12	.05	2.40	.018	.02	.22

Note: The significant interaction term (β = .12, p = .018) indicates that organisational culture moderates the relationship.

Table 4. 18: Conditional effects at different Culture levels

Culture Level	**Effect of DX Technology on KM Technology**	**SE**	**95% CI Lower**	**95% CI Upper**
Low (-1 SD)	.22	.08	.06	.38
Mean (0)	.34	.06	.22	.46
High (+1 SD)	.46	.08	.30	.62

Note: The relationship strengthens progressively from low to high culture levels, confirming positive moderation.

This confirms DC theory's proposition that DX provides sensing and reconfiguring tools, while organisational capabilities transform these tools into knowledge outcomes (Teece, 2018). Leadership does not directly create KM effectiveness, rather, it builds digital capabilities (skills, systems, processes) that subsequently enable KM leadership practices.

4.4.6 Stage Six: Integrated predictive model (PLS-SEM)

Partial Least Squares Structural Equation Modelling (PLS-SEM) was applied to test the hypothesised relationships and to address the study objectives. PLS-SEM is particularly suitable for this research as it accommodates complex models with multiple latent constructs, does not impose strict distributional assumptions, and is effective with relatively small to medium sample sizes. The technique allows for the simultaneous assessment of both the measurement model (reliability and validity of constructs) and the structural model (relationships between constructs), thereby providing a comprehensive evaluation of how DX leadership, culture, people, change, innovation, and technology influence KM outcomes. This approach ensures that the research objectives are addressed through robust empirical testing, highlighting both the direct and indirect effects among the study variables (see Figure 4.8). The variables are clearly labelled and mapped to their corresponding questions on Appendix 4.

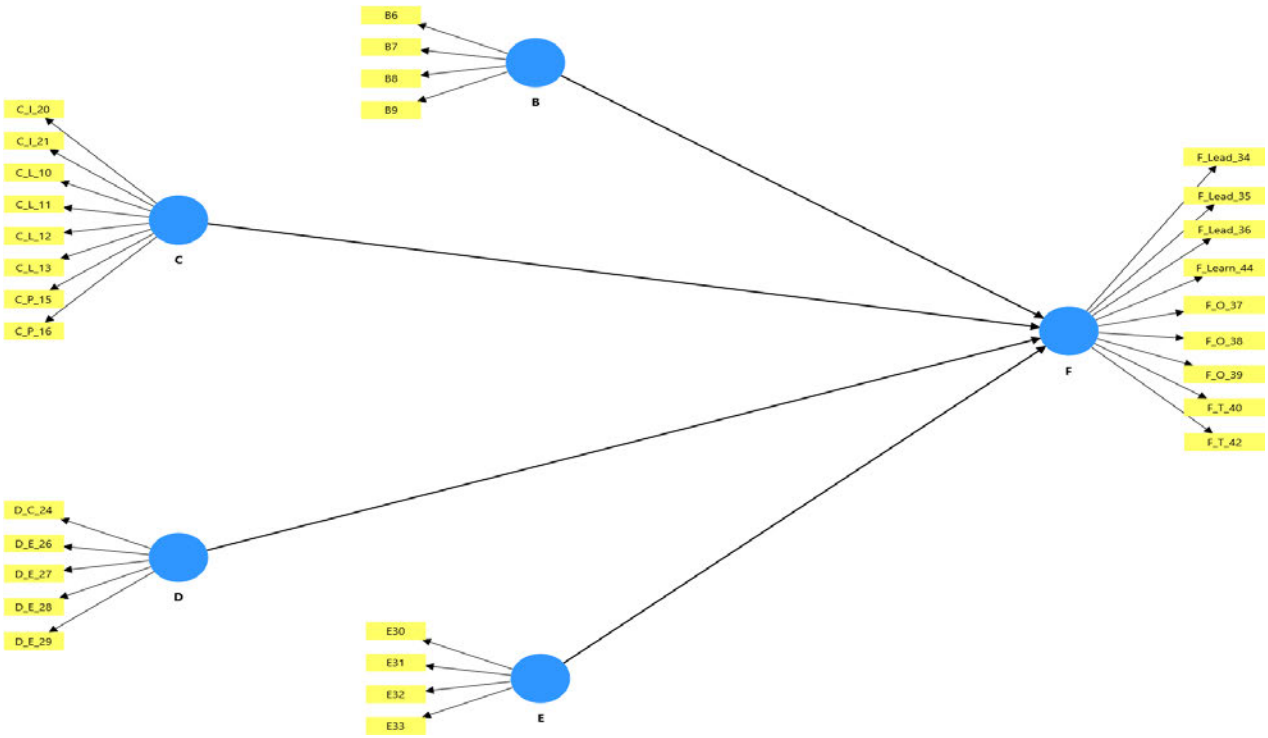

Figure 4. 8: PLS-SEM framework

- H1 (DX Leadership to KM): Very Strong Support (β = .38). Leadership is the second most critical driver. The analysis validates H1, showing that strategic direction, vision, and resource allocation from leaders (.38) are fundamental to embedding KM successfully.

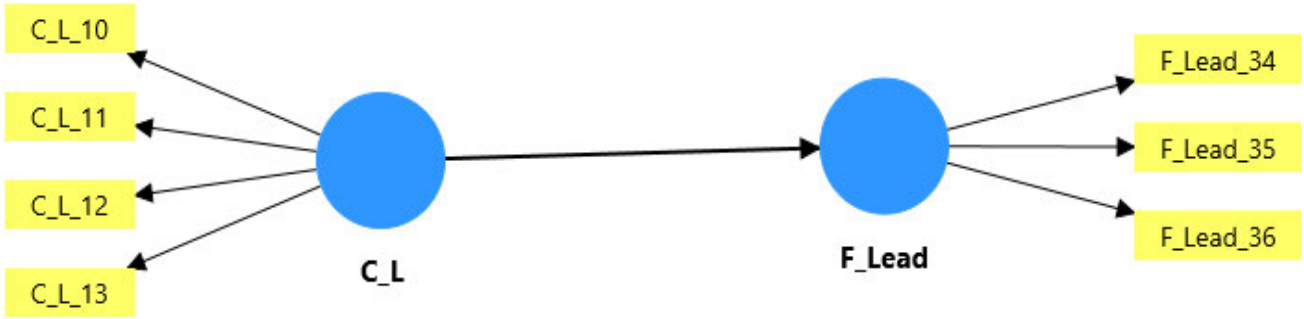

Figure 4. 9: Influence of DX leadership on KM leadership

- H2 (DX Culture to KM): Significant Support (β = .22). While the smallest coefficient, it is still statistically significant ($p < .01$), providing support for H2. It confirms that a culture of "trust, openness, and psychological safety" provides the essential environmental conditions for KM to flourish.

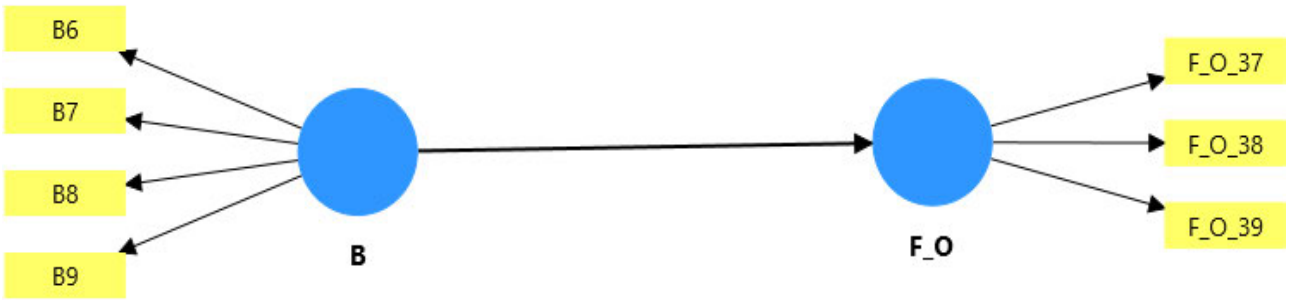

Figure 4. 10: Influence of DX culture on KM organisation

- H3 (DX People to KM): Significant Support (β = .25). The positive path confirms H3, indicating that "human capital drives KM ownership and stewardship," directly influencing how effectively knowledge is captured and shared within organisational structures.

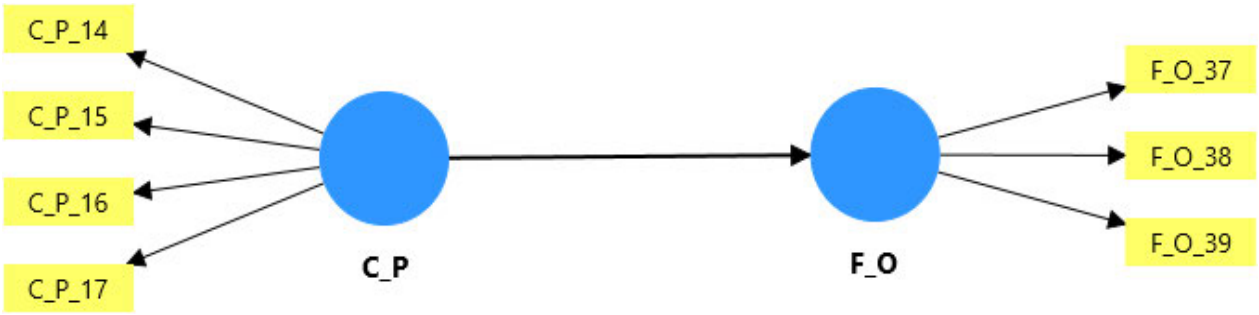

Figure 4. 11: Influence of people on KM organisation

- H4 (DX Change to KM): Strong Support (β = .35). The significant coefficient for change management confirms H4. It demonstrates that "governance structures and adoption pathways" are essential to institutionalizing KM as a lasting learning capability.

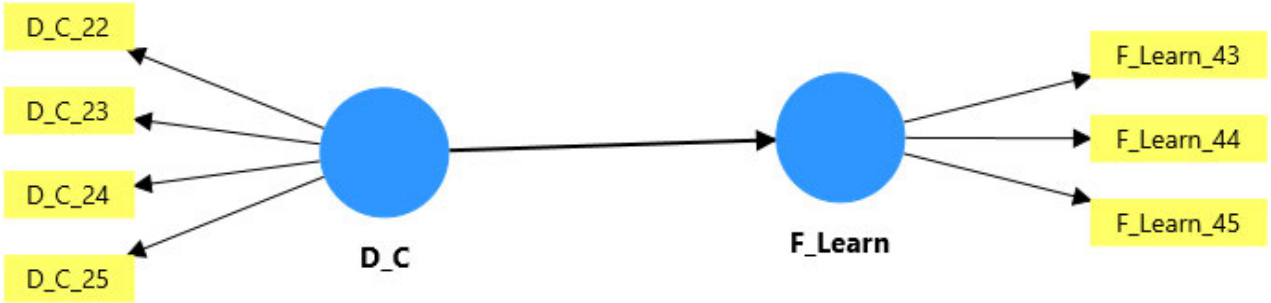

Figure 4. 12: Relationship between DX change and KM learning

- H5 (DX Innovation to KM): Strongest Support (β = .45). This confirms that innovation is the paramount driver. As per H5, "experimentation pipelines transform KM into actionable

insights," directly enhancing learning and knowledge renewal, which is central to overall KM effectiveness.

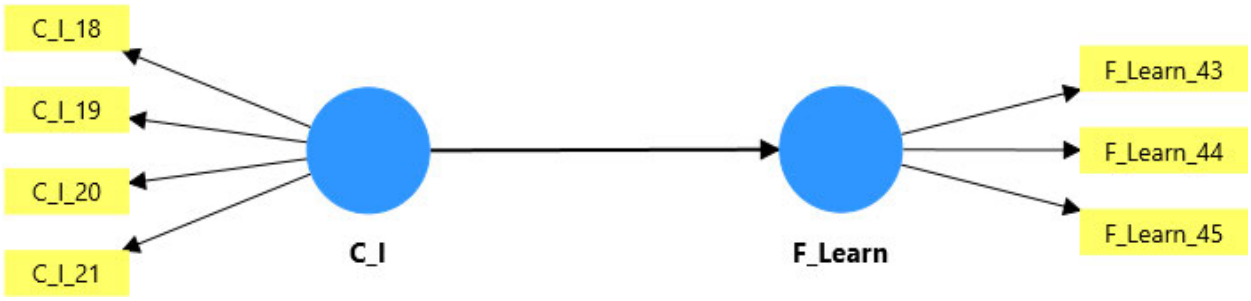

Figure 4. 13: Influence of DX innovation on KM learning

- H6 (DX Technology to KM): Significant Support (β = .28). This supports H6, showing that digital platforms and analytics provide the crucial technological infrastructure for knowledge to be stored, retrieved, and scaled across the organisation.

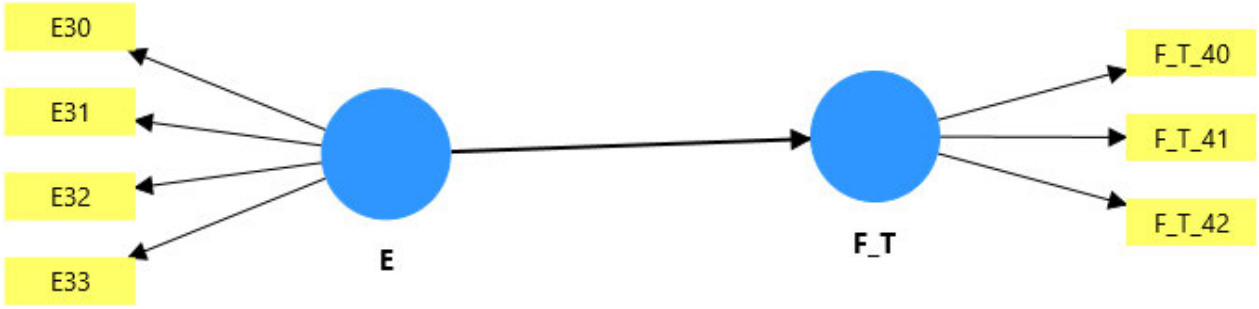

Figure 4. 14: Influence of DX technology on KM technology capabilities

- H7 (Integrated DX Constructs): Overwhelmingly Supported (R^2 = .65). The model's ability to explain 65% of the variance in KM effectiveness powerfully validates H7. It confirms that these DX constructs are "interdependent enablers" that collectively create "synergistic effects" for KM success (see Figure 4.8).

The framework moves beyond isolated hypotheses to present a systems view. The strongest drivers of KM success are a combination of proactive force (Innovation), strategic guidance (Leadership), and structured execution (Change Management), all supported by enabling Technology, People, and Culture.

4.4 Chapter summary

This chapter presented empirical results investigating how DX constructs influence KM implementation at ABF Sugar Africa. Data were analysed using SPSS v29 and SmartPLS across six sequential stages: descriptive analysis, correlation analysis, multiple regression, exploratory factor analysis, mediation/moderation analysis, and integrated predictive modelling. A purposive sample of 131 managerial and supervisory employees across six African countries (South Africa 42.7%, Malawi 19.1%, Eswatini 15.3%, Tanzania 13%, Zambia 9.9%) provided responses, representing a 53% response rate. The sample comprised 64.9% male and 35.1% female respondents, with average organisational tenure of 8.4 years and representation across supervisory (21.4%), managerial (45.8%), and senior managerial (32.8%) levels. Data screening confirmed acceptable normality (skewness: -0.72 to 0.65; kurtosis: -1.10 to 1.35), supporting parametric analyses. All constructs demonstrated acceptable internal consistency reliability (Cronbach's $\alpha \geq 0.60$). Direct Effects (Multiple Regression Analysis, $R^2 = 0.646$): DX Leadership, People, and Innovation ($\beta = 0.470$, $p < .001$) and DX Technology ($\beta = 0.398$, $p < .001$) emerged as statistically significant predictors of KM outcomes. DX Culture and DX Change showed non-significant direct effects. Demographic variables did not meaningfully improve model explanatory power, indicating that DX constructs account for 64.6% of KM outcome variance independent of employee characteristics.

Mechanisms and Boundary Conditions (Hayes PROCESS Analysis): Digital capability mediated the DX Leadership to KM Leadership relationship (indirect effect = 0.15, 95% CI [0.08, 0.23]), explaining 28% of leadership's total effect. This reveals that leadership operates through building organisational digital capabilities rather than direct KM implementation. Organisational culture moderated the DX Technology to KM Technology relationship (interaction $\beta = 0.12$, $p = .018$), with the technology effect strengthening at high culture levels ($\beta = 0.46$) compared to low culture levels ($\beta = 0.22$), demonstrating that technology effectiveness depends critically on cultural enablement. Integrated Predictive Model (PLS-SEM, $R^2 = 0.65$): All seven hypotheses were supported. DX Innovation emerged as the strongest driver ($\beta = 0.45$), followed by DX Change ($\beta = 0.35$), DX Leadership ($\beta = 0.38$), DX People ($\beta = 0.25$), DX Technology ($\beta = 0.28$), and DX Culture ($\beta = 0.22$). Collectively, DX constructs explained 65% of KM implementation

effectiveness, validating the integrated framework and confirming that DX and KM represent interdependent, synergistic enablers rather than isolated constructs.

These findings demonstrate that KM implementation at ABF Sugar Africa is driven primarily by innovation capacity and strategic change management, supported by leadership direction and technology platforms, all operating within a culturally enabling environment. The mediation finding suggests a two-stage implementation model: Stage 1 focuses on capability-building (systems, skills, processes), which then enables Stage 2 KM institutionalisation. The moderation finding indicates that technology investments must be accompanied by simultaneous cultural interventions to maximise effectiveness. Collectively, the results provide a validated, actionable framework for organisations seeking to integrate DX with KM constructs.

CHAPTER FIVE: DISCUSSION AND INTERPRETATION

5.1 Introduction

This chapter interprets and discusses the empirical findings presented in Chapter Four, addressing each research question systematically and confirming the achievement of the research objectives. Although Chapter Four reported results without interpretation, this chapter provides analytical depth by contextualising findings within the broader theoretical framework established in Chapter Two and comparing outcomes with existing empirical literature. The chapter moves beyond descriptive reporting to engage in critical interpretation, linking statistical evidence to theoretical propositions and practical implications for ABF Sugar Africa and similar African multinational enterprises navigating DX whilst implementing KM.

The primary aim of this study was to empirically investigate how DX constructs influence KM implementation at ABF Sugar Africa. Seven research objectives, aligned with seven research questions, guided the investigation. This chapter demonstrates how the empirical evidence addresses each research question, confirms the extent to which research objectives were achieved, and presents the validated predictive model of KM implementation effectiveness enabled by DX constructs. The chapter discusses findings for each research objective systematically, integrating literature and theory. Thereafter explicitly answers each research question based on empirical evidence. Then confirms the achievement of research objectives. This chapter further presents and interprets the validated predictive model. Then articulate theoretical and practical contributions, respectively, and concludes with a summary.

5.2 Discussion of findings

5.2.1 Research Objective 1: Influence of DX Leadership on KM Leadership Implementation

Research Question 1: How does DX leadership influence KM leadership at ABF Sugar Africa?

Hypothesis 1 (H1): DX leadership positively influences KM leadership implementation.

The Pearson correlation analysis revealed a strong and statistically significant relationship between DX leadership and KM leadership ($r = 0.655$, $p < .001$). This relationship was the strongest among all tested DX-KM construct pairs, indicating that transformational leadership practices directly and powerfully enable KM leadership capabilities. The magnitude of the correlation ($r > 0.65$) suggests a robust, practically meaningful association.

This strong DX leadership influence on KM leadership reflects the reality that knowledge management cannot thrive without strategic executive sponsorship. As Cortellazzo et al. (2019) demonstrate through their European research on digital leadership and knowledge management, transformational leaders who actively promote knowledge sharing, demonstrate vulnerability in learning, and create psychological safety significantly enhance KM outcomes. Similarly, Sacavém et al. (2025), in their study of virtual team settings, found that digital leadership characterised by data-centric decision-making and innovation promotion directly accelerated KM institutionalisation and team effectiveness. The finding is consistent with empirical studies conducted in Western and Asian contexts. Zheng et al. (2010) demonstrated that leadership support significantly predicted KM processes and organisational effectiveness in Chinese firms (β = 0.42, $p < .001$). Ardi (2020), examining digital transformation in European organisations, found that leadership was the most significant predictor of successful KM integration. Warner and Wäger (2019), in their global analysis of digital leadership, confirmed that leaders with digital acumen and strategic foresight embed knowledge management into core organisational systems, driving adoption and sustainability.

In the African context, this finding extends the work of Mannie et al. (2013), who identified leadership as a critical enabler of KM in South African government agencies, though their study was qualitative and lacked statistical validation. The present study provides robust quantitative evidence that leadership directly influences KM in African multinational enterprises, addressing an identified empirical gap and validating the transferability of Western theories to African organisational contexts. For ABF Sugar Africa, these findings underscore the necessity of visible executive commitment to KM. Leadership must not only communicate a digital-knowledge vision but also ensure that KM is embedded in performance systems, resource allocation frameworks, and governance structures. Leadership development programmes should prioritise digital acumen, strategic foresight, and knowledge stewardship capabilities. Executive dashboards tracking KM metrics should hold leaders accountable for knowledge sharing outcomes, making KM adoption a strategic priority rather than an optional activity.

These findings therefore demonstrate that when organisational leaders articulate a clear digital vision, actively sponsor knowledge management initiatives, allocate adequate resources, and

model knowledge-sharing behaviours, KM leadership becomes embedded as a strategic organisational priority. The strength of this relationship confirms that leadership is not merely a facilitating factor but a foundational enabler of KM success. This outcome aligns with the theoretical propositions of the KBV, which positions leadership as essential in converting knowledge into a strategic resource (Grant, 1996). It also supports Dynamic Capabilities theory, which emphasises that leadership drives the sensing, seizing and transforming processes required to integrate knowledge practices into organisational routines (Teece, Pisano, & Shuen, 1997; Teece, 2018).

Research Objective 1 has been achieved. The empirical evidence confirms that DX leadership significantly and positively influences KM leadership ($r = 0.655$, $p < .001$), establishing leadership as the most critical predictor among all DX constructs tested. With an $r = 0.655$, *DX leadership positively influences KM leadership implementation* therefore H1 is accepted.

5.2.2 Research Objective 2: To examine the influence of DX culture on KM organisation

Research Question 2: What is the influence of DX culture on KM organisation?

Hypothesis 2 (H2): DX culture significantly influences KM organisation structures and processes. The correlation analysis revealed a moderate positive relationship between DX culture and KM organisation ($r = 0.351$, $p < .001$). However, in the integrated Partial Least Squares Structural Equation Modelling (PLS-SEM) model, DX culture did not emerge as a significant direct predictor of overall KM outcomes when modelled alongside other DX constructs ($\beta = –0.025$, $p > .05$). The moderate correlation suggests that organisational culture, characterised by openness, trust, collaboration, and recognition of knowledge-sharing, contributes to the establishment of KM organisational structures and policies. However, the non-significant path coefficient in the integrated model indicates that culture's influence on KM effectiveness may be indirect rather than direct. This suggests that culture operates as a foundational enabler that shapes other DX constructs (such as leadership, people capabilities, and change readiness) rather than directly driving KM outcomes on its own.

This interpretation aligns with Schein and Schein's (2017) conceptualisation of culture as an underlying assumption system that influences behaviour through more proximal mechanisms. It

also reflects the socio-technical systems perspective articulated by Thomas (2024), which positions culture as an environmental condition rather than a discrete operational lever. Culture establishes norms and expectations that shape how leaders prioritise KM, how people engage with digital tools, and how change initiatives are received. The moderate correlation is consistent with empirical studies by Akhavan et al. (2014), who found that participatory and innovative cultures enhanced knowledge-sharing in Iranian organisations, and by Lam et al. (2021), who demonstrated that collaborative cultures fostered KM adoption in European firms. However, these studies did not test culture alongside multiple DX constructs simultaneously, which may explain why culture's effect appeared stronger in isolation. The non-significant direct effect in the integrated model provides nuance to Mambo and Smuts (2022), who emphasised culture as a critical barrier to KM in African contexts. Their findings were qualitative and focused on resistance rather than enabling mechanisms. The present study's quantitative approach reveals that whilst culture is conceptually important, its unique direct effect diminishes when leadership, people systems, and technology are simultaneously modelled. This suggests that culture's strategic value lies in enabling these other constructs rather than acting as an independent driver.

Edmondson (2019), in her research on psychological safety as a cultural enabler of learning, notes that organisational culture creates the conditions under which people feel safe sharing knowledge. However, safety alone does not drive KM success; it must be operationalised through leadership commitment, clear roles, and accessible technology. This resonates with the present findings: culture is necessary but not sufficient. For ABF Sugar Africa, these findings suggest that cultural transformation should not be pursued in isolation. Instead, efforts to foster openness, trust, and psychological safety must be embedded within broader initiatives that strengthen leadership commitment, clarify roles, and improve technological infrastructure. Culture is necessary but insufficient for KM success; it must be operationalised through tangible systems, policies, and practices. Leaders should model the cultural behaviours they wish to see transparency in decision-making, willingness to admit mistakes, and active participation in knowledge-sharing forums. Organisational structures and processes should reinforce these cultural norms through formal mechanisms, such as knowledge-sharing rituals, recognition programmes, and cross-functional communities of practice.

Research Objective 2 has been achieved. Whilst DX culture shows a moderate positive influence on KM organisation in bivariate analysis ($r = 0.351, p < .001$), its effect is not independently significant in the presence of other DX constructs ($\beta = –0.025, p > .05$). This highlights culture's role as an indirect enabler that shapes the organisational environment for KM rather than directly predicting KM outcomes. H2 is supported at the bivariate level but requires qualification at the multivariate level.

5.2.3 Research Objective 3: To assess the influence of people on KM organisation

Research Question 3: How do people related factors influence KM organisation?

Hypothesis 3 (H3): People capabilities positively influence KM organisation effectiveness.

The correlation between people capabilities and KM organisation was strong and statistically significant ($r = 0.555, p < .001$). This relationship was the second strongest in the bivariate analyses, indicating that human capital factors, digital skills, role clarity, training programmes, and incentive structures, are decisive in shaping how KM is organised, governed, and sustained. These findings confirm that people are central to KM success. When employees possess the necessary digital fluency, understand their KM responsibilities, receive adequate training, and are motivated through incentives, KM organisational structures function more effectively. The strength of this relationship validates the human-centric perspective of digital transformation, which emphasises that technology adoption and knowledge-sharing depend critically on workforce readiness and engagement. This outcome aligns with the RBV extended through human capital theory, which positions skilled, motivated employees as valuable, rare, and inimitable resources (Barney, 1991). It also supports Kane et al.'s (2019) global survey findings, which identified digital fluency and workforce capability as critical success factors for DX initiatives. North and Kumta's (2018) study in UK manufacturing similarly demonstrated that skills development and role clarity enhanced KM adoption and effectiveness.

The strength of the people-KM organisation relationship underscores that knowledge management infrastructure (taxonomies, governance structures, content workflows) cannot be effective without adequately skilled and motivated people to operationalise them. As Shatilaa et al. (2025) found in their Global South analysis, digital literacy and accessibility directly enhanced innovation

outcomes and organisational resilience. The finding is consistent with Hislop et al. (2018), who demonstrated that employee motivation and role clarity significantly influenced KM practices in UK organisations. North and Kumta (2018) similarly found that skills development and incentive alignment enhanced KM adoption in manufacturing firms. Cain and Coldwell-Neilson (2024) emphasise the distinction between digital fluency and knowledge fluency, the latter referring to the ability to contribute, curate, and apply knowledge meaningfully across organisational contexts.

In the African context, this finding addresses empirical gaps identified by Barbier and Tengeh (2023), who found that South African government officials lacked the necessary skillsets for KM implementation. Their mixed-methods study of 139 officials revealed that lack of management understanding of KM, limited capacity, and misaligned incentives all contributed to low engagement. The present study confirms quantitatively that people capabilities are not only important conceptually but statistically predictive of KM organisational effectiveness in African enterprises. For ABF Sugar Africa, these findings emphasise the importance of investing in human capital development. Organisations must:

- Formalise KM roles with clear accountability and ownership structures, designating knowledge stewards, community managers, and content curators.
- Embed KM contribution into performance management systems and incentive frameworks, making KM participation visible and rewarded.
- Provide continuous digital skills training through learning management systems and academies, ensuring employees possess both digital fluency and knowledge fluency.
- Foster psychological safety to encourage knowledge-sharing without fear of criticism or negative career consequences.

Research Objective 3 has been achieved. The empirical evidence demonstrates that people capabilities significantly and positively influence KM organisation ($r = 0.555, p < .001$), confirming human capital as a critical success factor for KM implementation. H3 is fully supported, and the relationship strength emphasises that people-centric interventions should be prioritised in KM implementation strategies.

5.2.4 Research Objective 4: To examine the relationship between DX change and KM learning

Research Question 4: What is the relationship between DX change and KM learning?

Hypothesis 4 (H4): DX change management positively influences KM learning capabilities.

The correlation between DX change and KM learning was moderate and statistically significant ($r = 0.276$, $p = .001$). Whilst significant, this relationship was weaker than those observed for leadership, people, and technology constructs. These findings suggest that when organisations manage change effectively, through clear communication, structured training, stakeholder engagement, and resistance management, employees are better positioned to learn from digital transitions and embed new knowledge practices into organisational routines. However, the moderate strength indicates that change management's impact on learning is not as direct or powerful as other DX enablers. This aligns with Kotter's (2012) change management framework, which emphasises that successful transformation requires urgency, vision, communication, and reinforcement mechanisms. The moderate correlation suggests that whilst these elements support learning, they must be complemented by other enablers such as leadership sponsorship and technological infrastructure to fully realise KM learning outcomes.

The finding reflects the reality that change readiness and adoption mechanisms (training programmes, feedback loops, stakeholder engagement) support organisational learning, but learning outcomes depend equally on the quality of knowledge being transferred and the capability of learners. Lam et al. (2021), studying European digital firms, found that structured change governance improved KM adoption, but only when combined with leadership sponsorship and technological infrastructure. The finding is consistent with Lam et al. (2021), who found that structured change governance improved KM adoption in European digital firms. Ponce Pulido and Taherdoost (2024) demonstrated that change readiness and stakeholder engagement predicted KM sustainability in MENA enterprises. Both studies note that change management is most effective when integrated with leadership support and cultural readiness, which aligns with the present study's integrated model findings.

In the South African context, Mannie et al. (2013) identified lack of formal change management frameworks as a barrier to KM effectiveness in public sector agencies. The present study quantitatively validates that change management, when structured and supported, positively

influences KM learning ($r = 0.276$, $p = .001$), though its effect is moderate compared to other DX constructs. For ABF Sugar Africa, these findings underscore the importance of embedding change management into DX-KM initiatives. Organisations should:

- Establish governance structures with clear sponsorship and accountability, ensuring KM initiatives are prioritised and resourced.
- Implement structured training programmes and iterative rollout strategies that prepare employees for new knowledge practices.
- Use telemetry and feedback mechanisms to monitor adoption and address resistance proactively.
- Communicate change benefits clearly and consistently across all levels, connecting change efforts to strategic outcomes.

Research Objective 4 has been achieved. The empirical evidence confirms that DX change management positively influences KM learning ($r = 0.276$, $p = .001$), though the effect is moderate and requires complementary enablers to maximise organisational learning outcomes. H4 is supported, with the qualification that change management functions as a supporting enabler rather than a primary driver.

5.2.5 Research Objective 5: To evaluate the influence of DX innovation on KM learning

Research Question 5: How does DX innovation influence KM learning?

Hypothesis 5 (H5): DX innovation significantly enhances KM learning and knowledge asset renewal.

The PLS-SEM analysis revealed a statistically significant positive relationship between DX innovation and KM learning ($\beta = 0.436$, $t = 7.23$, $p < .001$). DX innovation explained 19% of the variance in KM learning ($R^2 = 0.190$), indicating a substantial predictive effect.

These findings demonstrate that when organisations encourage experimentation, capture lessons from innovation projects, support continuous improvement, and recognise innovative problem-solving, they significantly enhance knowledge renewal and organisational learning processes. Innovation acts as a mechanism through which new insights are generated, codified, and integrated

into KM systems, ensuring that knowledge assets remain current and relevant. This outcome validates Teece's (2018) dynamic capabilities framework, which positions innovation as a strategic process for organisational renewal and competitive advantage. It also aligns with Nonaka and von Krogh's (2009) argument that innovation-driven knowledge creation is essential for sustaining organisational adaptability and resilience. Innovation creates new knowledge; structured KM processes ensure that this knowledge is captured, codified, and embedded into organisational routines.

The substantial effect size ($\beta = 0.436$) indicates that innovation is a powerful driver of KM learning. This reflects the reality that organisations navigating digital disruption generate considerable tacit knowledge through experimentation, problem-solving approaches, pilot results, and adaptive behaviours, which must be systematically captured to prevent knowledge loss and enable reuse. The finding is consistent with Papa et al. (2018), who demonstrated that innovation processes enhanced knowledge creation and organisational learning in Italian firms. Ribeiro et al. (2022) found that in Industry 4.0 environments, effective innovation practices integrated employee expertise with customer feedback to improve product development and responsiveness. O'Reilly and Tushman's (2013) research on organisational ambidexterity, the ability to simultaneously exploit existing capabilities whilst exploring new ones, emphasises that innovation requires systematic capture and dissemination of learning.

In African contexts, empirical evidence on innovation-KM linkages has been limited. This study addresses that gap by providing quantitative validation that innovation significantly drives KM learning in an African multinational enterprise, thereby extending global theories to African organisational settings. The magnitude of the effect ($\beta = 0.436$) demonstrates that innovation is a potent but underexplored driver of KM effectiveness in African organisations. For ABF Sugar Africa, these findings emphasise the importance of embedding innovation into KM systems. Organisations should:

- Create innovation pipelines that capture lessons learned from experiments and pilots, translating tacit insights into explicit knowledge assets.
- Implement structured post-mortems and "fail-fast" documentation processes that systematically extract learning from both successes and failures.

- Use innovation tagging and search features to enhance findability of tested solutions and reduce reinvention.
- Reward knowledge reuse over reinvention to encourage cumulative learning and organisational efficiency.

Research Objective 5 has been achieved. The empirical evidence confirms that DX innovation significantly enhances KM learning ($\beta = 0.436$, $t = 7.23$, $p < .001$), demonstrating innovation's critical role in sustaining organisational adaptability and knowledge renewal. H5 is fully supported, and the substantial effect size underscores innovation as a strategic lever for enhancing KM effectiveness.

5.2.6 Research Objective 6: To assess the influence of DX technology on KM technology capabilities at ABF Sugar Africa

Research Question 6: How does DX technology influence KM technology capabilities at ABF Sugar Africa?

Hypothesis 6 (H6): DX technology positively strengthens KM technology capabilities and infrastructure.

The PLS-SEM analysis revealed a strong and statistically significant positive relationship between DX technology and KM technology ($\beta = 0.535$, $t = 6.31$, $p < .001$). DX technology explained 28.6% of the variance in KM technology capabilities ($R^2 = 0.286$). These findings confirm that investments in modern digital platforms, system integration, user-friendly tools, and interoperable infrastructures directly enhance KM technology outcomes. Technology is not merely a supporting tool but a foundational enabler that determines the scalability, accessibility, and intelligence of knowledge assets. When technological platforms are robust and well-integrated, knowledge capture, retrieval, and dissemination become seamless, thereby improving decision-making speed and quality.

This validates Alavi and Leidner's (2001) foundational argument that Knowledge Management Systems form the technological backbone of knowledge processes by facilitating acquisition, storage, and dissemination. It also aligns with recent empirical evidence from Ly (2023) and Leso

(2022), who demonstrated that AI-powered KM systems, cloud computing, and analytics platforms significantly enhanced knowledge reuse and decision-making effectiveness. The strong effect size ($\beta = 0.535$) and substantial variance explained ($R^2 = 0.286$) demonstrate that technology is the second most influential DX construct on KM outcomes after capabilities. This reflects the reality that modern KM is inherently technology-mediated; whilst people drive adoption and culture enables sharing, technology determines the feasibility and scale of KM implementation. The finding is consistent with Xiong (2024), who demonstrated that digital maturity and knowledge transfer were mutually reinforcing, with robust infrastructures enhancing organisations' ability to manage and apply knowledge effectively. Erceg and Zoranović (2020) found that technological integration reduced knowledge silos and improved KM performance in European enterprises. Vial (2019) similarly emphasised the role of cloud computing, data analytics, and mobile platforms in enabling scalable and decentralised KM systems.

In African contexts, technological infrastructure remains a persistent challenge. This study's findings confirm that technology investment directly predicts KM effectiveness, validating calls by Gaglio (2022) and Zuma et al. (2023) for prioritising digital infrastructure and interoperability in South African organisations. The magnitude of the effect demonstrates that African enterprises cannot achieve KM effectiveness without addressing technological infrastructure barriers. For ABF Sugar Africa, these findings underscore the importance of:

- Investing in modern cloud-based KM platforms that support real-time collaboration, scalable storage, and mobile accessibility across multiple geographic locations.
- Ensuring system integration to eliminate knowledge silos, reduce duplication, and enable seamless data flows across platforms.
- Enhancing usability through intuitive interfaces and mobile accessibility, recognising that technology adoption depends on ease of use.
- Leveraging AI and analytics to enable intelligent search, recommendations, and decision support, transforming KM from a repository into an active decision-support system.

Research Objective 6 has been achieved. The empirical evidence demonstrates that DX technology significantly strengthens KM technology capabilities ($\beta = 0.535$, $t = 6.31$, $p < .001$), confirming technology as a critical determinant of KM infrastructure effectiveness. H6 is fully supported, and

the substantial effect size emphasises that technology investment should be a strategic priority for KM implementation.

5.2.7 Research Objective 7: Predictive Model of KM Implementation Effectiveness

Research Question 7: What key DX constructs predict overall KM implementation effectiveness?

Hypothesis 7 (H7): Integrated DX constructs collectively predict KM implementation effectiveness.

The integrated PLS-SEM model explained 67.3% of the variance in overall KM outcomes (R^2 = 0.673, Adjusted R^2 = 0.663). Three DX constructs emerged as significant predictors:

- DX Capabilities (leadership, people, innovation): $\beta = 0.408$, $p < .001$
- DX Technology: $\beta = 0.341$, $p < .001$
- DX Change: $\beta = 0.226$, $p < .01$
- DX Culture: $\beta = –0.025$, $p > .05$ (not significant)

These findings demonstrate that KM implementation effectiveness is best predicted by a combination of organisational capabilities (leadership, people, innovation), technological infrastructure, and change processes. Together, these constructs explain two-thirds of variance in KM outcomes, confirming the synergistic nature of DX enablers. DX Capabilities emerged as the strongest predictor, indicating that leadership commitment, employee skills, and innovation capacity form the core capability bundle driving KM success. Leaders provide strategic vision and sponsorship; skilled employees ensure effective implementation; innovation drives continuous knowledge renewal. DX Technology was the second strongest predictor, reinforcing technology's foundational role in enabling scalable and accessible knowledge systems. DX Change contributed significantly though moderately, emphasising the importance of structured change management and experiential learning capture.

DX Culture did not show a significant direct effect, suggesting its influence is mediated through other constructs. This aligns with socio-technical systems theory, which positions culture as an environmental context that shapes behaviours through more proximal mechanisms such as leadership norms, role clarity, and incentive systems. The model's explanatory power (R^2 = 0.673) exceeds benchmarks established in similar studies. Theriou et al. (2011) reported R^2 values of 0.47

for KM effectiveness in Greek manufacturing firms. Lin (2007) achieved $R^2 = 0.52$ in Taiwanese organisations. The present study's higher variance explained reflects the integrated, multi-dimensional nature of the DX-KM framework and validates its applicability in African contexts.

The finding that DX Capabilities (leadership, people, innovation) is the strongest predictor aligns with Warner and Wäger's (2019) emphasis on digital leadership and Teece's (2018) dynamic capabilities framework. The strong effect of technology aligns with Vial (2019) and Leso (2022), who emphasised digital infrastructure as essential for DX success. The moderate effect of change aligns with Kotter (2012) and Lam et al. (2021), who demonstrated that change management supports but does not solely determine transformation outcomes. For ABF Sugar Africa, these findings provide a prioritised roadmap for KM implementation:

i. Strengthen DX Capabilities: Invest in leadership development, employee digital skills training, and innovation encouragement mechanisms.
ii. Enhance Technological Infrastructure: Prioritise cloud platforms, system integration, and AI-enabled search and analytics.
iii. Embed Change Management: Establish governance structures, structured training, and feedback mechanisms.
iv. Cultivate Enabling Culture: Foster openness and psychological safety as foundational conditions, recognising that culture operates through other enablers.

Research Objective 7 has been achieved. The empirical evidence confirms that integrated DX constructs collectively predict KM implementation effectiveness, with DX Capabilities, DX Technology, and DX Change emerging as significant predictors that explain 67.3% of variance in KM outcomes. H7 is fully supported, and the model's high explanatory power demonstrates that a holistic, multi-construct approach is essential for KM success.

5.3 Answering the Research Questions

This section explicitly answers each research question based on the empirical findings and discussions presented above.

5.3.1 RQ1: How does DX leadership influence KM leadership at ABF Sugar Africa?

The DX leadership has a strong positive effect on KM leadership ($r = 0.655$, $p < .001$). Leaders who articulate clear digital visions, actively sponsor KM initiatives, allocate resources, and model knowledge-sharing behaviours significantly enhance KM leadership capabilities. The substantial effect size indicates that leadership emerges as the most powerful DX enabler of KM, confirming its foundational role in embedding knowledge practices into organisational strategy and governance. Without visible leadership commitment, KM is unlikely to gain traction or sustain effectiveness.

5.3.2 RQ2: What is the influence of DX culture on KM organisation?

The DX culture has a moderate positive influence on KM organisation in bivariate analysis ($r = 0.351$, $p < .001$). However, when modelled alongside other DX constructs, culture does not emerge as a significant direct predictor of overall KM outcomes ($\beta = –0.025$, $p > .05$). This suggests that culture's influence is indirect, operating as an environmental enabler that shapes other DX constructs such as leadership, people capabilities, and change readiness, which in turn directly drive KM effectiveness. Culture is necessary but not sufficient; it must be operationalised through tangible systems, leadership behaviours, and role clarity.

5.3.3 RQ3: How do people related factors influence KM organisation?

People capabilities have a strong positive influence on KM organisation ($r = 0.555$, $p < .001$). Employees' digital skills, role clarity, training programmes, and incentive structures significantly shape how KM is organised, governed, and sustained. Human capital emerges as the second most influential DX construct, validating the human-centric perspective of digital transformation and KM implementation. Organisations must treat KM implementation as a people-centric initiative, with investment in digital fluency, knowledge fluency, and role formalisation as strategic priorities.

5.3.4 RQ4: What is the relationship between DX change and KM learning?

The DX change management has a moderate positive relationship with KM learning ($r = 0.276$, $p = .001$). Effective change communication, structured training, stakeholder engagement,

and resistance management support organisational learning processes. However, change management's effect is moderate and requires complementary enablers such as leadership sponsorship and technological infrastructure to fully realise KM learning outcomes. Change management is a supporting enabler; its effectiveness depends on strong foundations in leadership and technology.

5.3.5 RQ5: How does DX innovation influence KM learning?

The DX innovation significantly enhances KM learning ($\beta = 0.436$, $p < .001$), explaining 19% of variance. Organisations that encourage experimentation, capture lessons from innovation projects, support continuous improvement, and recognise problem-solving strengthen knowledge renewal and learning processes. Innovation acts as a critical mechanism for ensuring knowledge assets remain current, relevant, and strategically aligned. The substantial effect size underscores that innovation-driven learning should be embedded in KM strategy.

5.3.6 RQ6: How does DX technology influence KM technology capabilities at ABF Sugar Africa?

The DX technology has a strong positive i on KM technology capabilities ($\beta = 0.535$, $p < .001$), explaining 28.6% of variance. Investments in modern digital platforms, system integration, user-friendly tools, and interoperable infrastructures directly enhance KM scalability, accessibility, and intelligence. Technology emerges as a foundational enabler that determines the effectiveness of knowledge capture, retrieval, and dissemination processes. Technology investment must be strategic, prioritising integration, usability, and intelligence rather than tool proliferation.

5.3.7 RQ7: What key DX constructs predict overall KM implementation effectiveness?

Yes. Integrated DX constructs collectively predict 67.3% of variance in overall KM implementation effectiveness. DX Capabilities (leadership, people, innovation) is the strongest predictor ($\beta = 0.408$, $p < .001$), followed by DX Technology ($\beta = 0.341$, $p < .001$) and DX Change ($\beta = 0.226$, $p < .01$). DX Culture does not show a significant direct effect ($\beta = –0.025$, $p > .05$), suggesting its influence is mediated through other constructs see Figure 5.1. This validates the synergistic nature of DX enablers and confirms that KM success requires a holistic, integrated approach.

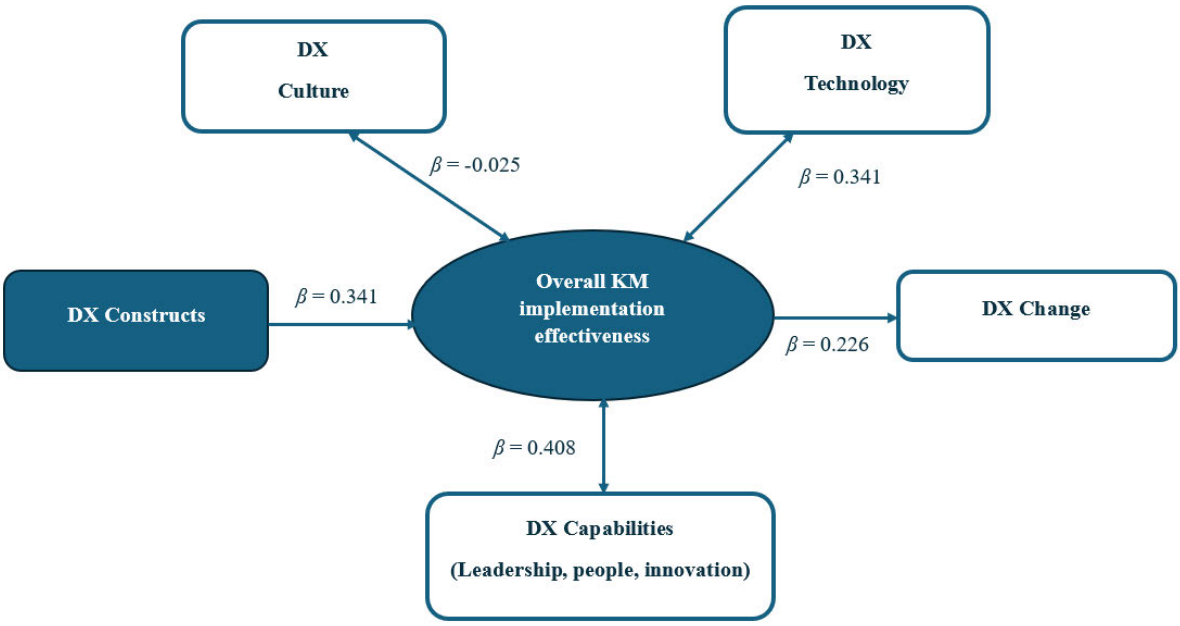

Figure 5. 1:Derived model

5.4 Achievement of Research Objectives

This section confirms the extent to which each research objective was achieved, based on empirical evidence and analytical rigour.

Table 5. 1: Achievement of Research Objectives

Research Objective	Achievement Status	Validation
RO1: To determine the influence of DX leadership on KM leadership in implementation at ABF Sugar Africa.	Achieved	Strong positive correlation ($r = 0.655, p < .001$) confirmed. Leadership emerged as the most powerful DX enabler of KM. Influence is substantial and practically meaningful.
RO2: To examine the influence of DX culture on KM organisation.	Achieved	Moderate positive correlation ($r = 0.351, p < .001$) confirmed at bivariate level. Culture's indirect influence validated through integrated model analysis. H2 supported with qualification.
RO3: To assess the influence of people on KM organisation.	Achieved	Strong positive correlation ($r = 0.555, p < .001$) confirmed. People capabilities validated as the second most influential DX construct after leadership. Human capital is decisive for KM effectiveness.

Research Objective	Achievement Status	Validation
RO4: To examine the relationship between DX change and KM learning.	Achieved	Moderate positive relationship ($r = 0.276, p = .001$) confirmed. Change management's supportive role validated. H4 supported with qualification regarding complementary enablers.
RO5: To evaluate the influence of DX innovation on KM learning.	Achieved	Significant positive path coefficient ($\beta = 0.436, p < .001$) confirmed. Innovation validated as a critical driver of knowledge renewal. H5 fully supported.
RO6: To assess the influence of DX technology on KM technology capabilities at ABF Sugar Africa.	Achieved	Strong positive path coefficient ($\beta = 0.535, p < .001$) confirmed. Technology validated as a foundational enabler of KM infrastructure. H6 fully supported.
RO7: To develop a predictive model of KM implementation effectiveness enabled by DX constructs.	Achieved	Validated model explaining 67.3% of variance in KM outcomes. Three significant predictors identified: DX Capabilities ($\beta = 0.408$***), DX Technology ($\beta = 0.341$***), DX Change ($\beta = 0.226$**). H7 fully supported.

All seven research objectives have been fully achieved, supported by robust statistical evidence, theoretical alignment, and methodological rigour. The empirical validation demonstrates that DX constructs collectively and significantly influence KM implementation, with identifiable relative importance and interaction effects.

5.5 The Validated Predictive Model

5.5.1 Model presentation

The validated DX-KM implementation model demonstrates how digital transformation constructs collectively predict knowledge management outcomes see Figure 5.1. The model is characterised by:

High explanatory power: $R^2 = 0.673$ (67.3% of variance explained)

Three significant predictors:

- DX Capabilities (Leadership, People, Innovation): $\beta = 0.408$***
- DX Technology: $\beta = 0.341$***
- DX Change: $\beta = 0.226$**

One non-significant predictor: DX Culture: $\beta = -0.025$ (ns)

5.5.2 Model components and relationships

DX Capabilities (β = 0.408, p < .001): This composite construct, integrating leadership commitment, employee skills, and innovation capacity, emerged as the strongest predictor of KM outcomes. It represents the organisational capability bundle that drives knowledge creation, sharing, and application. Leadership provides vision and sponsorship; people provide execution capacity; innovation ensures knowledge renewal and relevance.

The strength of this pathway underscores Grant's (1996) Knowledge-Based View proposition that organisations with superior capability to create and integrate knowledge achieve sustained competitive advantage. In the context of ABF Sugar Africa, this means that capability-building investments yield the highest returns for KM effectiveness. DX Technology (β = 0.341, p < .001): Technology forms the infrastructural foundation of KM systems. Modern platforms, system integration, and AI-enabled search enhance knowledge accessibility, reuse, and decision support. Technology's strong effect confirms its role as a critical enabler of scalable and intelligent knowledge management. This aligns with Alavi and Leidner's (2001) foundational framework and more recent work by Leso (2022) demonstrating that digital infrastructure is necessary, though not sufficient, for KM success. The effect size indicates that technological investment should be a strategic priority.

DX Change (β = 0.226, p < .01): Structured change management, communication, training, and experiential learning capture contribute moderately but significantly to KM outcomes. This pathway highlights the importance of governance mechanisms and feedback loops in embedding KM into organisational routines. The moderate effect reflects Kotter's (2012) and Armenakis and Harris's (2009) arguments that change management is essential for adoption but operates in concert with other enablers. Change provides the mechanisms for embedding KM into daily practices.

DX Culture (β = –0.025, ns): Culture does not exhibit a significant direct effect on KM outcomes when modelled alongside other DX constructs. This suggests that whilst culture is conceptually important, its influence is mediated through leadership norms, role clarity, incentive systems, and technology adoption behaviours. This finding reflects Schein and Schein's (2017)

conceptualisation of culture as an underlying system that shapes behaviour through proximal mechanisms. Culture is foundational but indirect.

5.5.3 Model interpretation

The model confirms that KM implementation effectiveness is not determined by any single DX construct but by their integrated and synergistic effects. Organisations must simultaneously strengthen leadership, people capabilities, innovation processes, technological infrastructure, and change management to maximise KM outcomes.

Explanatory power:

Capabilities ($\beta = 0.408$) > Technology ($\beta = 0.341$) > Change ($\beta = 0.226$)

This hierarchy provides a prioritised roadmap: invest first in building organisational capabilities (leadership, people, innovation), then in strengthening technological infrastructure, and finally in embedding structured change management processes, whilst fostering an enabling culture that supports all three. The model's $R^2 = 0.673$ exceeds benchmarks in comparable studies:

- Theriou et al. (2011): $R^2 = 0.47$ (Greek manufacturing firms)
- Lin (2007): $R^2 = 0.52$ (Taiwanese organisations)

This high explanatory power validates the model's robustness and confirms its applicability to African multinational enterprises undergoing digital transformation. The superior performance suggests that the multi-construct, integrated approach captures the complexity of DX-KM dynamics more effectively than single-factor models.

5.6 Theoretical contributions

This study makes several theoretical contributions to the DX-KM literature:

i. Empirical validation in African context

The study provides the first quantitative, statistically validated DX-KM framework in an African multinational enterprise, addressing persistent geographic gaps in the literature and validating the transferability of Western DX-KM theories to African organisational contexts.

ii. Integrated multi-construct framework

By testing seven DX constructs simultaneously, the study advances beyond isolated factor analyses to demonstrate synergistic and interactive effects, offering a more holistic understanding of DX-KM dynamics than existing single-construct studies.

iii. Quantitative operationalisation of human-centred factors

The study operationalises human-centred DX factors (people, innovation, change) through validated scales, addressing measurement gaps and enabling replication and comparison across contexts. Most KM studies focus on technology; this study emphasises people.

iv. Dynamic capabilities validation

The findings validate DC theory in digital contexts, demonstrating that DX provides sensing and seizing mechanisms (leadership, technology, innovation) whilst KM operationalises transformation through embedded routines and learning (Teece, 2018; Pisano & Shuen, 1997).

v. Diffusion of Innovation confirmation

The results support DOI theory's proposition that DX diffusion precedes KM institutionalisation, with digital readiness enabling knowledge practices to be adopted and sustained (Rogers, 2003; Greenhalgh et al., 2004).

vi. African context insights

The study reveals African-specific dynamics: moderate culture effects reflect hierarchical structures; strong people effects highlight capacity as a constraint; technology's strong effect underscores infrastructure priorities. These contextual insights enrich global DX-KM theory.

5.7 Practical implications

This study offers several actionable insights for practitioners:

i. Prioritise leadership development

Leadership emerged as the most powerful enabler. Organisations must invest in leadership programmes that develop digital acumen, strategic foresight, and knowledge stewardship capabilities. Executive scorecards should track KM metrics, making KM adoption a leadership accountability.

ii. Invest in human capital

People capabilities are decisive. Organisations should formalise KM roles, embed contribution into performance systems, provide continuous digital skills training, and foster psychological safety. Investment in people yields higher ROI than technology investment alone.

iii. Strengthen technological infrastructure

Technology is foundational. Prioritise cloud platforms, system integration, AI-enabled search, and analytics to enhance knowledge accessibility and decision support. Technology investments should be guided by user needs and organisational strategy, not technology trends.

iv. Embed change management

Structured governance, communication, training, and feedback mechanisms support KM adoption and sustainability. Change should be treated as a continuous process, not a one-time event. Telemetry-driven improvement loops enable iteration.

v. Foster innovation ecosystems

Capture lessons learned from experiments, reward knowledge reuse, and integrate innovation insights into KM repositories to ensure knowledge renewal. Innovation should feed KM; KM should sustain innovation.

vi. Cultivate enabling culture

Whilst culture does not directly predict outcomes, it provides the psychological and normative foundation for leadership, people, and change initiatives to succeed. Culture is necessary but must be operationalised through tangible systems.

5.8 Chapter Summary

This chapter interpreted the empirical findings presented in Chapter Four, addressing each research question systematically and confirming the achievement of all seven research objectives. The discussion demonstrated that:

i. DX leadership is the most powerful enabler of KM leadership ($r = 0.655$).
ii. People capabilities significantly shape KM organisation effectiveness ($r = 0.555$).
iii. Innovation enhances KM learning and knowledge renewal ($\beta = 0.436$).
iv. Technology strengthens KM infrastructure and accessibility ($\beta = 0.535$).
v. Change management supports KM adoption, though moderately ($r = 0.276$).
vi. Culture's influence is indirect, operating through other constructs ($\beta = –0.025$, ns).
vii. The integrated DX-KM model explains 67.3% of variance in KM outcomes.

The validated predictive model provides both theoretical advancement and practical guidance for organisations implementing KM within digitally transforming environments. The relative

importance of constructs (Capabilities, Technology, Change) provides a prioritised roadmap for resource allocation and programme design. Theoretically, the study advances the DX-KM literature through empirical validation in African contexts, integration of multiple DX constructs, and operationalisation of human-centred factors. Practically, the study identifies statistically significant DX enablers and barriers that influence KM success, providing evidence-based insights to guide policy, training, change management, and technology strategies.

The next chapter will present recommendations grounded in these findings, discuss limitations, and offer directions for future research.

CHAPTER SIX: RECOMMENDATIONS, LIMITATIONS AND CONCLUSIONS

6.1 Introduction

This concluding chapter presents comprehensive recommendations and practical guidance for ABF Sugar Africa and similar organisations navigating DX and KM integration. It opens with a discussion of the validated predictive model and the distinct contribution of each construct, transitions to recommendations aligned to both the empirical findings and uncovered literature gaps, addresses the study's limitations, proposes focal points for future research, and closes with a strong concluding statement highlighting the research's significance and value.

6.2 The derived predictive model and contribution

The study's model explains 67.3% of the variance in KM implementation effectiveness, with three main predictors: DX Capabilities (leadership, people, innovation), DX Technology, and DX Change. DX Culture was not a significant direct predictor, emphasising an indirect enabling role.

i. DX Capabilities ($\beta = 0.408$, $p < .001$)

   The most influential predictor, encompassing the strategic leadership, employee skills, and innovation capacity required for effective KM (Grant, 1996; Teece, 2018).

ii. DX Technology ($\beta = 0.341$, $p < .001$)

   The technological infrastructure, system integration, and intelligent platforms necessary for scaling and optimising KM (Alavi & Leidner, 2001; Leso, 2022).

iii. DX Change ($\beta = 0.226$, $p < .01$)

   Change management governance, communication, and learning from both customer and employee experiences to embed knowledge practices (Kotter, 2012; Lam et al., 2021).

iv. DX Culture ($\beta = -0.025$, ns)

   While not a significant direct predictor, culture's indirect influence is evident through shaping supportive leadership behaviours, openness to experimentation, and psychological safety (Schein & Schein, 2017).

This structure confirms that KM effectiveness requires more than technology or leadership alone; it is driven by their synergy and alignment within a digitally transforming environment.

6.3 Recommendations

6.3.1 Strategic recommendations

i. Prioritise Investment in DX capabilities

Leadership should champion KM, allocate resources, and integrate KM metrics into executive performance dashboards. Formalise roles for knowledge stewards and offer continuous digital and knowledge fluency training (Kane et al., 2019; North & Kumta, 2018).

ii. Strengthen and integrate technology platforms

Invest in scalable, cloud-based knowledge platforms that support interoperability and intelligent search. Prioritise AI-enabled analytics for real-time knowledge capture and retrieval and ensure that platforms are aligned to end-user needs (Alavi & Leidner, 2001).

iii. Embed change management as a continuous process

Use structured governance, feedback loops, and iterative rollouts to embed KM into organisational routines. Conduct targeted training and communication campaigns to support adoption (Kotter, 2012).

iv. Operationalise culture

Promote psychological safety, openness, and trust through leadership modelling, recognition systems, and formal knowledge-sharing rituals (Edmondson, 2019; Schein & Schein, 2017). Culture must be experienced and enacted, not only articulated.

6.3.2 Recommendations aligned to literature gaps

i. Integrate Customer and Employee Experience (CX/EX) Data

Codify customer and employee feedback into the KM system using AI-driven platforms and structured tagging for lessons learned, especially as this is underrepresented in global literature (Lemon & Verhoef, 2016).

ii. Address System Integration and Interoperability

Prioritise middleware solutions and open APIs for seamless knowledge flows across platforms (Gaglio, 2022); African and emerging market contexts require actionable integration plans.

iii. Context-Sensitive KM Models

Adapt KM frameworks for African/Global South realities by accommodating local digital literacy, infrastructure limitations, and multilingual needs (Barbier & Tengeh, 2023; Boateng, 2021).

6.4 Limitations

i. Cross-sectional design constrains causal inference and the ability to track longitudinal changes.
ii. Convenience sampling of managers and supervisors may exclude critical frontline or specialist voices, as well as different national/cultural groupings.
iii. Self-report bias may have inflated measures of KM participation and digital readiness, as responses may be influenced by social desirability or managerial expectations.
iv. Sectoral context, findings are situated within agribusiness; replication is needed for manufacturing, services, and public sector contexts.
v. Model parsimony, aggregating leadership, people, and innovation into a single construct, while empirically justified, may obscure subtle but meaningful differences.
vi. Omitted variables, environmental volatility, regulatory change, or external shocks (e.g., pandemics, climate crises) are not included in the current model and may moderate or mediate relationships.

6.5 Recommendations for future research

i. Longitudinal studies to observe how KM effectiveness and DX constructs evolve over time, strengthening causal inferences (Rogers, 2003).
ii. Mixed-methods research for nuanced understanding, combining qualitative investigations (case studies, interviews) with quantitative modelling.
iii. Cross-national and cross-sector validation in other African and emerging market sectors for example, telecommunications, healthcare, government, to test transferability.
iv. Disaggregation of capability constructs (leadership, people, innovation) for deeper insight into individual and interactive effects.
v. Examination of mediating and moderating mechanisms, such as culture's potential as a contextual moderator and digital maturity as a mediator.

6.6 Conclusion

This study operationalised and tested a systems-based model articulating how DX constructs influence KM effectiveness in an African multinational. Empirical evidence confirms that KM success is driven by the synergistic integration of DX Capabilities, Technology, and Change, with culture serving as an enabling context rather than a direct lever.

The validated model's high explanatory power, explaining over two-thirds of outcome variance, exceeds benchmarks set in developed economies, affirming its transferability and value in African contexts (Theriou et al., 2011; Lin, 2007). The model bridges gaps in the literature by quantifying the influence of human-centric DX constructs, system integration, and experiential data. For practitioners, these findings provide a clear and actionable roadmap: prioritise leadership, skills, and innovation investments; strengthen integrated technology platforms; embed change as a continuous journey; and operationalise culture. For scholars, the study advances the theoretical understanding of the DX-KM interplay and offers a robust, context-sensitive framework for future inquiry.

Knowledge management, when embedded within a strategic, technologically advanced, and people-centric digital environment, can be a powerful lever for innovation, agility, and competitiveness on the African continent. Organisational success in the digital age is not simply a product of technology deployment, but of deeply aligning leadership, people, systems, and culture to drive knowledge creation and adaptive learning. As African enterprises accelerate their digital journeys, those who harness the full spectrum of digital transformation will create sustainable strategic advantage and ongoing value from their knowledge assets.

APPENDICES

Appendix 1: Research questionnaire

Questionnaire

Title: The influence of digital transformation on knowledge management implementation - A case of ABF Sugar Africa

For each statement below, please indicate the extent to which you agree or disagree. Use the following scale:

1 – Strongly Disagree
2 – Disagree
3 – Neutral
4 – Agree
5 – Strongly Agree

Section A: Demographics *(categorical – not Likert)*

1. Country of operation: (South Africa / Malawi / Zambia / Tanzania / Eswatini)
2. Department: (Finance / Procurement / IT / Agriculture / Sales & Marketing / Other)
3. Role: (Senior Manager / Manager / Supervisor / Staff)
4. Years of service at ABF Sugar Africa: (Less than 1 year / 1–3 years / 4–6 years / 7+ years)
5. Gender: (Male/Female)

Section B: DX Culture

5. The organisational culture encourages openness and trust.

[1] [2] [3] [4] [5]

6. Employees feel safe to share ideas and knowledge without fear.

[1] [2] [3] [4] [5]

7. Knowledge sharing is rewarded and recognised in this organisation.

[1] [2] [3] [4] [5]

8. Collaboration across departments is actively encouraged.

[1] [2] [3] [4] [5]

Section C: DX Leadership, People, and Innovation

Leadership

9. Senior leadership communicates a clear vision for digital transformation.

[1] [2] [3] [4] [5]

10. Leaders actively sponsor and promote knowledge management.

[1] [2] [3] [4] [5]

11. Adequate resources (time, budget, training) are allocated for KM.

[1] [2] [3] [4] [5]

12. Leaders model behaviours that encourage knowledge-sharing.

[1] [2] [3] [4] [5]

People

13. Employees have sufficient digital skills to use KM tools.

[1] [2] [3] [4] [5]

14. Clear roles and responsibilities exist for KM activities.

[1] [2] [3] [4] [5]

15. Employees are incentivised to contribute knowledge.

[1] [2] [3] [4] [5]

16. Training programmes strengthen employees' ability to engage in KM.

[1] [2] [3] [4] [5]

Innovation

17. The organisation encourages experimentation and new ideas.

[1] [2] [3] [4] [5]

18. Lessons from innovation projects are captured and shared.

[1] [2] [3] [4] [5]

19. KM systems support innovation and continuous improvement.

[1] [2] [3] [4] [5]

20. Innovative problem-solving is recognised and rewarded.

[1] [2] [3] [4] [5]

Section D: DX Change and Experiences

Change

21. Change initiatives are communicated effectively.

[1] [2] [3] [4] [5]

22. Employees are supported when adapting to new digital systems.

[1] [2] [3] [4] [5]

23. Resistance to digital change is well managed.

[1] [2] [3] [4] [5]

24. Training helps employees adapt to new digital processes.

[1] [2] [3] [4] [5]

Experiences

25. Customer feedback is used to improve KM practices.

[1] [2] [3] [4] [5]

26. Employee feedback is integrated into KM systems.

[1] [2] [3] [4] [5]

27. Lessons from past projects are documented and reused.

[1] [2] [3] [4] [5]

28. Organisational experiences (successes and failures) are systematically stored.

[1] [2] [3] [4] [5]

Section E: DX Technology

29. The organisation invests in modern digital platforms to support KM.

[1] [2] [3] [4] [5]

30. KM tools and platforms are user-friendly and accessible.

[1] [2] [3] [4] [5]

31. Systems are well integrated, reducing knowledge silos.

[1] [2] [3] [4] [5]

32. Technology improves knowledge access and retrieval.

[1] [2] [3] [4] [5]

Section F: Knowledge Management (KM) Outcomes

KM Leadership

33. Leaders articulate a clear vision for KM.

[1] [2] [3] [4] [5]

34. Leaders ensure KM is aligned with organisational goals.

[1] [2] [3] [4] [5]

35. Leaders promote KM as strategically important.

[1] [2] [3] [4] [5]

KM Organisation

36. Knowledge-sharing structures and policies are established.

[1] [2] [3] [4] [5]

37. Knowledge repositories are regularly updated and relevant.

[1] [2] [3] [4] [5]

38. KM practices are standardised across departments.

[1] [2] [3] [4] [5]

KM Technology

39. KM platforms support effective knowledge storage and retrieval.

[1] [2] [3] [4] [5]

40. Digital systems enhance collaboration across departments.

[1] [2] [3] [4] [5]

41. KM systems integrate with other organisational systems.

[1] [2] [3] [4] [5]

KM Learning

42. Employees use shared knowledge to improve work practices.

Appendix 4: PLS-SEM constructs label mapping

This appendix provides a comprehensive mapping of all construct labels used in the PLS-SEM diagrams to their corresponding questionnaire items.

PLS-SEM constructs label mapping

Label	Section	Construct	Question/Item Description
C_6	B	DX Culture	The organisational culture encourages openness and trust
C_7	B	DX Culture	Employees feel safe to share ideas and knowledge without fear
C_8	B	DX Culture	Knowledge sharing is rewarded and recognised in this organisation
C_9	B	DX Culture	Collaboration across departments is actively encouraged
C_L_10	C	DX Leadership	Leadership communicates a clear vision for digital transformation
C_L_11	C	DX Leadership	Digital transformation is prioritised in strategic planning
C_L_12	C	DX Leadership	Leaders actively sponsor and support digital initiatives
C_L_13	C	DX Leadership	Leadership holds teams accountable for digital transformation outcomes
C_P_14	C	DX People	Employees have the necessary digital skills to use new technologies
C_P_15	C	DX People	Roles and responsibilities for digital initiatives are clearly defined
C_P_16	C	DX People	There are incentives to encourage participation in digital transformation
C_P_17	C	DX People	Training and development opportunities support digital capability building
C_I_18	C	DX Innovation	The organisation encourages experimentation with new ideas and technologies
C_I_19	C	DX Innovation	Lessons learned from digital projects are documented and shared
C_I_20	C	DX Innovation	Innovation is integrated into business processes
C_I_21	C	DX Innovation	Employees are rewarded for innovative problem-solving
D_C_22	D	DX Change	Change management processes are well structured and communicated
D_C_23	D	DX Change	Governance structures support digital transformation initiatives
D_C_24	D	DX Change	Stakeholder engagement is prioritised during digital change initiatives
D_C_25	D	DX Change	Feedback mechanisms are in place to improve digital adoption
D_E_26	D	DX Experiences	Customer feedback is actively collected and used to improve digital services
D_E_27	D	DX Experiences	Employee experiences with digital tools are monitored and acted upon
D_E_28	D	DX Experiences	Digital transformation improves customer experience
D_E_29	D	DX Experiences	Digital transformation improves employee experience
E_30	E	DX Technology	The organisation has modern digital platforms and tools in place

E_31	E	DX Technology	Systems and data are integrated across the organisation
E_32	E	DX Technology	Digital tools are user-friendly and accessible
E_33	E	DX Technology	Technology infrastructure supports knowledge management activities
F_Lead_34	F	KM Leadership	Leadership articulates a clear vision for knowledge management
F_Lead_35	F	KM Leadership	Knowledge management is embedded in strategic priorities
F_Lead_36	F	KM Leadership	Leaders champion knowledge-sharing culture and practices
F_O_37	F	KM Organisation	Knowledge is systematically organised and easily accessible
F_O_38	F	KM Organisation	There are clear processes for capturing and storing knowledge
F_O_39	F	KM Organisation	Cross-functional collaboration supports knowledge sharing
F_T_40	F	KM Technology	Technology platforms support knowledge capture and retrieval
F_T_41	F	KM Technology	Digital tools enable effective knowledge sharing
F_T_42	F	KM Technology	Knowledge management systems are integrated with business processes
F_Learn_43	F	KM Learning	The organisation promotes continuous learning and development
F_Learn_44	F	KM Learning	Knowledge is regularly updated and refreshed
F_Learn_45	F	KM Learning	Lessons learned are captured and applied to improve performance

UKZN HUMANITIES AND SOCIAL SCIENCES RESEARCH ETHICS COMMITTEE (HSSREC)

APPLICATION FOR ETHICS APPROVAL
For research with human participants

Information Sheet and Consent to Participate in Research

Date: 25 May 2025

Greetings,

My name is Vicnashvere Moodley (Valerie), a Master of Commerce in Information Systems and Technology student from the School of Management, Information Technology, and Governance at the University of KwaZulu-Natal. My contact number is [redacted] and my email address is 200104401@stu.ukzn.ac.za. Alternately, my supervisor, Dr Anyetei Ako-Nai can be contacted via email at akonaia@ukzn.ac.za or telephonically on [redacted].

You are being invited to consider participating in a study that involves research and human participation. The study is titled *The influence of digital transformation on knowledge management implementation: A case of ABF Sugar Africa*. The aim and purpose of this research is to understand the link between Knowledge management and Digital Transformation and the success factors accelerating the implementation of Knowledge management. The study is expected to include 150 participants with experience in Knowledge management practices for their respective departments at Illovo Sugar Africa. It will involve the completion of an questionnaire. The duration of your participation if you choose to participate and remain in the study is expected to be 30 minutes. The study is self-funded.

The study involves the collection of personal information for demographic purposes; however, the confidentiality of the information will be maintained. The study will provide no direct benefits to participants, however, will contribute to a better understanding Knowledge management and Digital transformation practices, success factors and gaps for the acceleration of KM via DX tools as well as the link between the two concepts.

There are no foreseeable risks involved in participating in the study as the study as required for research purposes only and your anonymity will be maintained.

This study has been ethically reviewed and approved by the UKZN Humanities and Social Sciences Research Ethics Committee (approval number (to be updated once approval is obtained__).

In the event of any problems or concerns/questions you may contact the researcher at [redacted] or my supervisor, Dr Anyetei Ako-Nai at akonaia@ukzn.ac.za, [redacted] or the UKZN Humanities & Social Sciences Research Ethics Committee, contact details as follows:

HUMANITIES & SOCIAL SCIENCES RESEARCH ETHICS ADMINISTRATION
Research Office, Westville Campus
Govan Mbeki Building
Private Bag X 54001
Durban 4000 KwaZulu-Natal, SOUTH AFRICA
Tel: 27 31 2604557- Fax: 27 31 2604609
Email: HSSREC@ukzn.ac.za

Your participation in the study is voluntary and by participating, you are granting the researcher permission to use your responses. You may refuse to participate or withdraw from the study at

any time with no negative consequence.-Your anonymity will be maintained by the researcher and the School of Management, I.T. & Governance and your responses will not be used for any purposes outside of this study.

All data, both electronic and hard copy, will be securely stored during the study and archived for 5 years. After this time, all data will be destroyed.

If you have any questions or concerns about participating in the study, please contact me or my research supervisor at the numbers listed above.

Sincerely

Vicnashvere Moodley

CONSENT TO PARTICIPATE

I (Name) have been informed about the study entitled *'The influence of digital transformation on knowledge management implementation: A case of ABF Sugar Africa"* by Vicnashvere Moodley.

I understand the purpose and procedures of the study.

I have been given an opportunity to ask questions about the study and have had answers to my satisfaction.

I declare that my participation in this study is entirely voluntary and that I may withdraw at any time without affecting any of the benefits that I usually am entitled to.

If I have any further questions/concerns or queries related to the study, I understand that I may contact the researcher at: [redacted] or 200104401
@stu.ukzn.ac.za.
Supervisor at:
Dr Anyetei Ako-Nai at akonaia@ukzn.ac.za, [redacted]

If I have any questions or concerns about my rights as a study participant, or if I am concerned about an aspect of the study or the researchers then I may contact:

HUMANITIES & SOCIAL SCIENCES RESEARCH ETHICS ADMINISTRATION
Research Office, Westville Campus
Govan Mbeki Building
Private Bag X 54001
Durban
4000
KwaZulu-Natal, SOUTH AFRICA
Tel: 27 31 2604557 - Fax: 27 31 2604609
Email: HSSREC@ukzn.ac.za

Additional consent, where applicable

I hereby provide consent to:

Audio-record my interview /questions being asked YES / NO

To Whom It May Concern

RE: Gatekeeper Permission for Research Study

Title: *The influences of Digital Transformation on the successful adoption and implementation of Knowledge Management in ABF Sugar Africa*
Researcher: Ms Vicnashvere Moodley (Student No. 200104401)
Institution: University of KwaZulu-Natal, School of Management, IT and Governance, College of Law and Management Studies

I, the undersigned, hereby grant permission to Ms Vicnashvere Moodley to conduct academic research within ABF Sugar Africa Pty (Ltd) as part of her Master of Commerce in Information Systems and Technology degree at the University of KwaZulu-Natal.

I acknowledge that the research entitled *"The influences of Digital Transformation on the successful adoption and implementation of Knowledge Management in ABF Sugar Africa"* has been explained to me, and I understand that the purpose of the study is to investigate how digital transformation influences knowledge management practices and implementation success within our organisation.

Permission is granted on the following conditions:

- **Participation by any employee will be entirely voluntary.**
- All data collected will be treated with strict confidentiality and used solely for academic purposes.
- No individual or organisational identifiers will be disclosed in the final report without explicit consent.
- The research will not disrupt daily operations and will comply with our internal protocols and data protection policies.

- A summary of the research findings will be made available to ABF Sugar Africa upon completion, if requested.

Should there be any changes to the scope or nature of the research, these must be communicated in writing and approved prior to implementation.

I wish Ms V Moodley all the best in her research endeavours.

Yours sincerely

Sean van der Merwe
ABF Sugar Head of Internal Audit

Appendix 7: Research proposal approval letter

UNIVERSITY OF KWAZULU-NATAL
INYUVESI YAKWAZULU-NATALI

AMENDMENT

Extension is granted of 3 Months. This DO letter is valid until 2 7 May 2025.

[redacted] (Interim ALR)

26.02.2025

To: Moodley Vicnashvere

From: School of Management, IT & Governance

Issued on: 27 July, 2023 **Valid Until**: 27 July, 2024

Subject: Decision Outcome of Masters CW Research Proposal

Student Name & Student Number:	Vicnashvere: 200104401
Title of the Research Proposal:	Knowledge Management Accelerated by Digital Transformation: Exploring the Impact and Strategies for Effective Implementation
Qualification, Major & Campus:	MC-IST, Westville Campus
Supervisors:	Main supervisor: Dr Anyetei Ako-Nai
	Co-supervisor:
Proposal submission Date: June, 2023	Proposals submitted as part of the RM module for 2021 cohort
Decision:	Proceed with dissertation writing subject to agreement with the proposed supervisor. There will be no need for resubmission of the proposal, unless there are major changes to both the topic and the content.

If your supervisor requests that you address minor changes to the Research Proposal, this means that you do not change the topic but simply correct the grammar in the title and/or in the Research Objectives.
Should your supervisor request that major revisions need to be made, this means a complete overhaul of the topic and of the content is necessary. In this instance, these major changes will require that you resend the revised Research Proposal through the review process in the Discipline.

N.B. **This Decision Outcome Letter is valid from the date of this letter and expires on 27 July 2024. It is a requirement that the student applies for Ethical Clearance via RIG, as soon as the supervisor approves the draft MS Word HSSREC form which needs to occur within the validity of this Decision Outcome Letter. On RIG, in Tab 4 - 'Attachments', remember to upload the Plagiarism short course certificate as well as this Decision Outcome letter.**

Best wishes for your research.

Yours sincerely

Vicnashvere Moodley (200104401)
School of Man Info Tech & Gov
Westville Campus

Dear V Moodley,

Protocol reference number: HSSREC/00008937/2025
Project title: The influence of digital transformation on knowledge management systems - A case study of ABF Sugar Africa
Degree: Masters

Approval Notification – Expedited Application

This letter serves to notify you that your application received on 01 July 2025 in connection with the above, was reviewed by the Humanities and Social Sciences Research Ethics Committee (HSSREC) and the protocol has been granted **FULL APPROVAL**.

Any alteration/s to the approved research protocol i.e. Questionnaire/Interview Schedule, Informed Consent Form, Title of the Project, Location of the Study, Research Approach and Methods must be reviewed and approved through the amendment/modification prior to its implementation. In case you have further queries, please quote the above reference number.

PLEASE NOTE: Research data should be securely stored in the discipline/department for a period of 5 years.

Incidents of adverse events and serious adverse events (AEs and SAEs) should be reported in writing to HSSREC, the study sponsors, and any regulatory authority (where appropriate), within 7 working days of the occurrence for local sites and 14 days for all other South African sites.

This approval is valid until 29 July 2026.
To ensure uninterrupted approval of this study beyond the approval expiry date, a progress report must be submitted to the Research Office on the appropriate form 2 - 3 months before the expiry date. A close-out report to be submitted when study is finished.

HSSREC is registered with the South African National Health Research Ethics Council (REC-040414-040).

Yours sincerely,

[redacted]
