A dissertation submitted in partial fulfilment of the requirements for the degree of

Master of Business Administration

Graduate School of Business and Leadership
College of Law and Management Studies

Supervisor: Prof. Stephen Migiro

2016
DECLARATION

I, Sibusiso Simamane, declare that:

i. The research reported in this dissertation, except where otherwise indicated, is my original work.

ii. This dissertation has not been submitted for any degree or examination at any other university.

iii. This dissertation does not contain other persons' data, pictures, graphs or other information, unless specifically acknowledged as being sourced from other persons.

iv. This dissertation does not contain other persons' writing, unless specifically acknowledged as being sourced from other researchers. Where other written sources have been quoted, then:

a) their words have been re-written but the general information attributed to them has been referenced;

b) where their exact words have been used, their writing has been placed inside quotation marks, and referenced.

v. This dissertation does not contain text, graphics or tables copied and pasted from the Internet; unless specifically acknowledged, and the source being detailed in the thesis and in the References sections.

Signed:

Sibusiso Simamane
Student No. 9035294
I dedicate this research to my late beloved mother, Bongiwe Miriam, uMahlamini, whose sacrifices and unconditional love against all odds, made it possible for me to realise this feat.
ACKNOWLEDGEMENTS

I would like to express my heartfelt indebtedness to the following people for making a meaningful contribution to my completion of this difficult journey:

- All glory and honour goes to God, the Almighty, for giving me the physical, mental and emotional fortitude to complete this journey.

- My wife, Zile and daughters, Tusiwo and Thuthukile, for their perseverance and for allowing me to take their precious time to undertake this mission.

- My supervisor, Prof. Stephen Migiro for professional guidance, advice and motivation which assisted me to complete this dissertation.

- The respondents, who have devoted their time and shared their insights and views that greatly enriched this study.

- To my MBA colleagues, for their support, encouragement, shared knowledge and honest friendship which contributed immensely to my attainment of this degree.
ABSTRACT

This study seeks to interrogate the effects of the perceived lack of job satisfaction, loyalty and organizational commitment on South African teachers and to explore the possible causal factors leading to this phenomenon. To illustrate the extent and seriousness of the problem, the Minister of Basic Education has revealed that some 25,000 teachers left their jobs between 2005 and 2008. She also conceded that South Africa was producing 12,000 less teachers a year than required by the system. The Department of Basic Education has had to resort to recruiting teachers from countries like Zimbabwe and Cuba especially in critical subjects such as Mathematics and Science. This state of affairs points to a system that is in a serious crisis and an urgent need to get to the bottom of the problem.

The aim of the study was to explore the factors impacting on the levels of Job Satisfaction, Loyalty and Organizational Commitment among South African teachers. The study objectives were: 1. To find out if the lack of job satisfaction, loyalty and organizational commitment affect the productivity of teachers in South Africa. 2. To interrogate the possible causal factors that contribute to the perceived lack of job satisfaction, loyalty and organizational commitment among South African teachers. 3. To establish the roles that can be played by different education stakeholders to improve the levels of job satisfaction, loyalty and organizational commitment among South African teachers.

Face-to-face open-ended interviews were conducted with a total of 16 teachers comprising of school principals, heads of departments (HODs) and post level 1 educators. Participants were drawn from six secondary schools. Two schools were sampled from the urban, quintile three schools. The second pair of schools was selected from the semi-rural, quintile two schools. The third pair was selected from the rural, quintile one schools. This was to ensure that responses would be a fair reflection of teachers' lived experiences from different economic and social backgrounds. In total six principals, four HODs and six post level 1 educators participated in the study. The key findings of the study indicate that there were serious challenges facing the education system ranging from heavy work load, especially in low-enrolment schools; a perception of unfairness in processes of promotions; policy uncertainty and a poor work environment. The implication is that there needs to be far-reaching changes in policy pertaining to staffing for schools, promotion processes, in-service training and the role of school governing bodies. The researcher is of the view that there needs to be a continuous search for the causes of
the system's underperformance. One area that should be a subject of a thorough research going forward is the suitability and effectiveness of the country's teacher-training curriculum.

CHAPTER ONE
OVERVIEW OF THE STUDY

1.1. Introduction

This study seeks to interrogate the effects of the perceived lack of job satisfaction, loyalty and organisational commitment on South African teachers and to explore the possible causal factors leading to this phenomenon. This chapter highlights the background of the study, which includes the rationale for the study; the review of relevant literature; the statement of the research problem; the research objectives; the research questions; the delimitation of the study; the assumptions of the study; the definitions of key terms and also outlines the structure of the dissertation.

1.2. Background of the study

The problems plaguing South Africa’s education system are well documented. Such problems include, among others, high teacher turnover and poor learner attainment in key subjects like Science and Mathematics. According to Mampana (2012), in spite of a number of targeted initiatives by the Department of Basic Education (DBE) to retain teachers in the system, the department was still faced with an unacceptably high number of teachers leaving their jobs.

High attrition of experienced personnel has been cited as one of the causal factors to South Africa’s failure to meet the millennium development goal of achieving the universal primary education by the year 2014 (Mampana, 2012). A recent study by the Human Sciences Research Council (HSRC) found that some teachers were bunking classes because they themselves struggled with primary school Mathematics (News 24.com, 2013).

The factors that point to the apparent lack of organisational commitment, job satisfaction and loyalty among South African teachers include the shockingly high level of absenteeism, high employee turnover and regular work stoppages and other forms of industrial actions, to mention just a few. It is reported that South Africa has the highest teacher absenteeism rate in Southern Africa. It is reported that on average one teacher is absent for nineteen (19) working days per academic calendar year (News 24.com, 2013). This translates to more than nine percent (9.5%) of learning and teaching time that is lost each year. This picture is even worse when one takes into account the fact that a substantial amount of teaching time is said to be
lost while teachers sit idle in staff rooms doing nothing. It is reported that township and rural school teachers use less than fifty (50) percent of class time on teaching, with the majority of that time spent sitting in staff rooms (Ndlovu, 2011).

To illustrate the extent and seriousness of the problem, the Minister of Basic Education has revealed that some 25 000 teachers left their jobs between 2005 and 2008. She also conceded that South Africa was producing 12 000 less teachers a year than required by the system (IOL News, 2010). The Department of Basic Education has had to resort to recruiting teachers from countries like Zimbabwe and Cuba, especially in critical subjects such as Mathematics and Science (Mampana, 2012). This state of affairs points to a system that is in a serious crisis and an urgent need to get to the bottom of the problem.

South Africa’s education system cannot improve and ultimately reach its true potential while these problems persist. It is, therefore, important that the root causes of the problems facing our education system are understood. This study should benefit all the major stakeholders involved in education, namely: the policy makers, the School Governing Bodies (SGBs), the school management teams, ordinary teachers, learners, labour unions and the teacher training institutions.

Numerous scholars and other opinion makers have done a considerable amount of research on the factors that affect organisational commitment, job satisfaction and loyalty on employees in general. There is overwhelming consensus that a lack organisational commitment, job satisfaction and loyalty impact negatively on employee productivity. Field and Buitendach (2011) argue that there is a strong correlation between organisational commitment and work engagement as well as happiness and work commitment. They then argue that happiness with one’s job is a prerequisite for engagement and commitment at work.

According to Rampa (2014), passion and motivation play a critical role in the quality of every employee’s performance in their jobs. He further emphasizes the importance of an enabling organisational culture and pleasant working conditions in the profession in fostering and sustaining the employee’s productivity. van Dyk and Coetzee (2012) argue that employee-centred HR practices, such as training and development, work-life balance, remuneration and recognition have a positive effect on work commitment of employees. Koolj et al. (2013)
argue that satisfied employees are time-effective at work and are not likely to take sick leave unless it is extremely necessary. It is, therefore, imperative that any factors that mitigate against employees giving their best at work be identified and addressed.

Job satisfaction refers to a positive emotional state resulting from the appraisal of one's job (Katsikea, Theodosiou, Perdikis, & Kehagias, 2011). Bakker and Oerlemans (2012) assert that high levels of subjective well-being are associated with high levels of job satisfaction, regular experiences of positive emotions and very rare experiences of negative emotions.

According to Patrick and Sonia (2012), employees form attitudes towards their jobs by taking into consideration their feelings, their beliefs and their behaviours. They further argue that, for this reason, job satisfaction can be defined either as the overall job satisfaction of an employee or the satisfaction with particular aspects of the job, such as pay, working conditions, co-workers, company policies, supervision, the work itself and opportunities for promotion.

Organisational commitment is defined as the preparedness of the employees to make a greater and determined effort on behalf of their organisations, a profound desire to stay in their organisations and advance their goals and values. The employees have a sense of duty to the organisation (Rothmann & Viljoen, 2009, cited in Field and Buitendach, 2011).

According to Allen and Meyer (1990), cited in Field and Buitendach (2011), Organisational commitment is three dimensional and comprises of affective commitment, normative commitment and continuity commitment.

* Affective commitment refers to the employee's state of emotional attachment to, involvement and identification with the organization.

* Normative commitment refers to the employee's feelings of compulsion to remain in the organization.

* Continuance commitment refers to commitment based on the costs that the employee associates with leaving the organization. Continuance commitment has two sub-dimensions, namely, personal sacrifice and lack of alternative.

According to Sypniewska (2014), job satisfaction generally results in a positive attitude towards one's work, co-workers as well as the entire organisation. She further argues that a
satisfied workforce builds and actively participates in the success of any organisation. The level of job satisfaction is further influenced by a sense of justice. Worker satisfaction is the outcome of what they receive in exchange for their contributions. Perceived fairness has a positive impact on the levels of motivation and satisfaction (Sypaiewska, 2014).

van Dyk and Coetzee (2012) further maintain that organisational commitment results in positive attitudes to jobs and affects outcomes like employees' intentions to leave, organisational citizenship behaviour, performance and job satisfaction. They further argue that, organisational and employee-centred human resource practices like work-life balance, compensation, supervisor support, communication, rewards and recognition, training and development, job characteristics and opportunities to develop careers, influence the commitment of employees.

1.3. The research problem statement

South Africa spends the highest percentage of her Gross Domestic Product (GDP) on education. It is clear though, that the huge resources that are pumped into the system do not yield commensurate results. The system is still face with challenges of learner underperformance in critical subjects like Science and Mathematics. The reported high rate of absenteeism among teachers as well as the high teacher turnover, among other challenges, point to a system that is not working optimally. This justifies continuous research into the underlying factors of the challenges in the system. This study seeks to examine the teachers' attitudes to their jobs and explore different interventions that can be made to enhance their job satisfaction and organisational commitment.

1.4. The research objectives

The general objective of the study is to explore the factors impacting on the levels of Job Satisfaction, Loyalty and Organisational Commitment among South African teachers. The specific study objectives are:

(a) To find out how job satisfaction, loyalty and organisational commitment affect the productivity of teachers in Ilembe District.

(b) To understand the factors that lead to the perceived lack of job satisfaction, loyalty and organisational commitment among teachers in Ilembe District.

(c) To establish the roles played by different education stakeholders to improve job satisfaction and organisational commitment among teachers in Ilembe District.
1.5. The research questions

To achieve the stated objectives, the study seeks to answer the following questions:

(a) How does job satisfaction, loyalty and organisational commitment affect the productivity and job performance of teachers in Ilembe District?

(b) What are the factors for the perceived lack of job satisfaction, loyalty and organisational commitment among teachers in Ilembe District?

(c) What contribution do different stakeholders make to improve the levels of job satisfaction, loyalty and organisational commitment among teachers in Ilembe District?

1.6. The significance of the research

The study is an attempt to get a better understanding of the challenges facing teachers in South Africa and to explore possible solutions. It is hoped that desired job attitudes on the part of teachers will go a long way in improving learner attainment and the standard of education in general. Furthermore, a thorough and continuous research on the topic is made necessary by the dismal performance of South African learners when compared with their peers from other African countries. The Southern and Eastern African Consortium for Monitoring Education Quality (SACMEQ) III looked at education inequality, and noted that the poorest 20% of South African learners perform far worse than most of their counterparts in other eastern and southern African countries (Spaull, 2012). In the 2011 Progress in International Reading Literacy Study (PIRLS) test, 43% of South African learners failed to attain the low international benchmark. Of the fifteen countries in the region, South Africa’s poorest learners were at 12th place for mathematics, and 14th for reading. (Howie et al., 2012).

Certainly, the huge investment made by the government in an effort to improve South Africa’s education and the country’s economic status on the continent should be manifest in the standard and quality of education in the country. The fact that this is not happening demands an ongoing probing for answers.
1.7. Delimitation of the study

The research is delimited to the views and lived experiences of school principals, heads of departments, and post level 1 teachers of six secondary schools in the Ilembe District of KwaZulu-Natal department of education. The study was conducted between May 2016 and September 2016.

1.8. Assumptions of the study

The study was premised on the following assumptions:

- There is a lot that needs to be done to enhance job satisfaction and organisational commitment of South African teachers.
- Improved job satisfaction and organisational commitment will result in improved productivity and efficiency by teachers thus impacting positively learner performance and attainment.

1.9. Definitions of key terms

1.9.1. Job satisfaction

Job satisfaction has been defined in numerous ways. Lumley et al. (2011:101) define job satisfaction as “an individual’s total feeling about their job and the attitudes they have towards various aspects or facets of their job, as well as an attitude and perception that could consequently influence the degree of fit between the individual and the organisation”.

According to Suma and Lesha (2013), job satisfaction is an affective response to the job seen either in its totality (global satisfaction) or with regard to specific aspects (facet satisfaction) i.e. pay, supervision etc. Job satisfaction is further understood as the positive orientation of a person towards the role which he/she is presently occupying and the degree to which the employee is comfortable and happy with his/her job (Suma & Lesha, 2013).

Job satisfaction is further defined as a gratifying or affirmative emotional state, resulting from the observation of one’s job as fulfilling or allowing the fulfilment of one’s essential job values (Suma & Lesha, 2013). Job satisfaction is an emotional reaction to a job condition, which is often determined by how well results match or exceed expectations, for instance, if workers think that they are treated unfairly and receive less remuneration, they are more
likely to have negative feelings towards their work, supervision or co-workers (Rehman et al., 2013).

1.9.2. Organisational commitment

Organisational commitment has become one of the most common variables studied in the last few decades. Like every other psychological constructs, organisational commitment does not have a universally accepted definition. It has been defined and measured in many different ways. The many definitions and measures have the common idea that organizational commitment is understood to be a bond between the individual and the organisation (Suna & Losha, 2013).

Organisational commitment is regarded as a psychological association an individual has with their organisation, characterised by profound identification with the organisation and a willingness to contribute to the attainment of organisational goals (Lumley et al., 2011).

Some scholars view organizational commitment as the strength of an employee’s involvement with an organisation. Others suggest that organisational commitment is shown through compatibility between personal and organisational values and goals (Sasaaty & Miradipta, 2013).

According to Mohamed and Anisa (2012) organisational commitment refers to the willingness of an employee to apply higher levels of hard work for the sake of the organization, approval of its strategic goals, principles, values and ethics and a strong desire to stay with the organization.

According to Loc et al. (2014) committed employees are generally loyal to their organisations and want to continue their association with their organisations even when there are better options in terms of pay and benefits.
1.10. The structure of the dissertation

Chapter 1- Introduction
In this chapter, the researcher provides a short overview, the motivation of the study, the focus for the research, the research objectives, the research questions, limitation of the study and conclusion.

Chapter 2- Literature Review
The researcher will be gathering information using theoretical aspects and any empirical work done by other scholars like journals, reports, books, newspapers to produce a sound and credible conceptual framework on the topic.

Chapter 3- Research Methodology
This chapter will deal with the selection of a research design that will suggest the correct method that will be used to collect data as well as the sampling method that will be chosen. The target group of people for the study will also be described in this chapter.

Chapter 4- Presentation and Discussion of the Findings
In this chapter, the researcher will present and discuss the findings of the study. The chapter will also examine the ethical issues, trustworthiness, validity, reliability and limitations of the study. The researcher will also outline the limitations of the study.

Chapter 5- Conclusion and Recommendations
This chapter will focus on the outcome of the study and the recommendations for future studies.
CHAPTER TWO
LITERATURE REVIEW

2.1. Introduction
This chapter explores different theoretical approaches to the concepts of job satisfaction and organisational commitment. This is done to ensure that the study is based on a clear and thorough understanding of different lines of thought concerning these concepts that have been developed by different scholars over the years. The chapter also deals with the review of relevant literature by various scholars pertaining to factors that impact on employees’ job satisfaction, productivity and organisational commitment. The aim is to establish the impact of such factors on the teachers’ attitudes towards their jobs and the resultant impact on the overall quality of education. Although this literature review deals with many factors and dimensions of job satisfaction and organisational commitment, the scope of the research will not extend to demographic information such as age and gender. The research focuses on teachers in general. Each section of the literature review has been examined with the objective of giving the researcher in-depth knowledge and the necessary theoretical background in order to formulate meaningful qualitative interview questions.

2.2. Theoretical and conceptual framework
There are different theoretical approaches to both the concepts of job satisfaction and organisational commitment. This section deals with the three different approaches that have been developed in explaining job satisfaction and measuring the employees' levels of satisfaction. The next part of this section will deal with the three-component conceptualization of organisational commitment. These theories and approaches are very important in trying to understand the reasons for employee behaviour and job attitudes in general. The literature covers relevant research work on job satisfaction and organisational commitment, including relevant concepts and constructs.

2.3. Approaches to Job Satisfaction

According to what Hackman and Oldham (1976) call the “information processing model” job satisfaction is solely dependent on the characteristics of the job. According to this approach, employees collect information about the job, the workplace and the organisation, and
cognitively evaluate these features in order to determine the level of satisfaction (Vanden Berghe, 2011).

The second model maintains that the measurement of the level of job satisfaction is based on information about past behaviour and what others at work think. It shifts its emphasis to the effects of the context and the impact of past behaviour, instead of individual pre-dispositions and cognitive decision-making processes. Therefore, job satisfaction is reliant on how others at work assess the workplace (Vanden Berghe, 2011).

The third approach maintains that job satisfaction is reliant on the attributes or the dispositions of individual employees. Such dispositions can be determined by experience or genetic heritage or both. In short, job satisfaction can be understood as a function of: (a) the features of a job, (b) the view of others and (c) the individual employee’s personality (Boys, Ockers & Schaap, 2007).

2.3.1. Job satisfaction as a function of job features

This approach to job satisfaction is divided into two theories; namely, i) the two-factor theory and ii) the job characteristics model.

1. Two-Factor Theory

Frederick Herzberg (1959), in his Two-Factor Theory deals with the issue of workplace motivation. The theory introduces two factors that account for overall job satisfaction and they are referred to as motivators and hygiene factors. Herzberg argues that while the existence of motivators in a job can lead to the improved levels of satisfaction, the nonexistence of hygiene factors in the workplace can lead to dissatisfaction. Hygiene factors refer to the atmosphere and the environment of the work. Such factors can include salary, safe working environment, etc. Motivators are associated with the features of the job itself (Vanden Berghe, 2011).

Herzberg’s theory explains why employees who earn high salaries and experience great working conditions still lack motivation. According to Herzberg these two elements only represent hygiene factors, which addresses the issue of dissatisfaction. He argues that motivation comes from the job itself. Therefore, it is essential for managers to look into the nature of the jobs they require their employees to perform. Herzberg argues that if you want
employees to perform well and do a great job, you should have a good job to start with. So, in order to improve productivity and job attitudes, employers must pay attention to both factors and not take it for granted that an increase in satisfaction will result in a consequential decrease in dissatisfaction (Buys, Ockers & Schaap, 2007).

ii. Job Characteristic Model

While Herzberg supported the creation of "good jobs", Richard Hackman and Greg Oldham (1976) built on that idea by endeavouring to define what we understand a "good job" to actually look like. In their Job Characteristic Model, they identified five central dimensions for assessing the immediate work environment. They argue that any job can be assessed for its motivating potential by making use of these five dimensions. The five dimensions, cited in (Vanden Berghe, 2011), are skill variety, task identity, task significance, autonomy and feedback.

- **Skill variety** refers to the extent to which a job entails the application of a number of diverse skills, capabilities, or talents. Such activities should not only be different, but must also be distinct enough to necessitate different skills (Vanden Berghe, 2011). Skill variety is an apparent diversity and complexity of skills and talents required by a job to perform it. A teacher, for example, must be good at data analysis and computer literate to be able to effectively analyse learner performance and come up with meaningful interventions. Therefore, employees must possess a range of skills in order to perform their jobs efficiently and effectively. Skill variety in an organization may be attained through continuous training as well as through job rotation (Mhlanga, 2012).

- **Task identity**, which defines the extent to which a job involves accomplishment of a whole and distinguishable piece of work. Task identity requires an employee to perform all the tasks required to complete the job from the beginning to the end of the production process. (Buys, Ockers & Schaap, 2007).

- **Task significance** refers to the importance of the job; the extent to which the job has an impact on the lives of other people and the organization or the external environment. According to Mhlanga (2012), the single most important impact on an employee's job satisfaction experience emanates from the type of the work assigned to them by the organization. It means that if the job entails sufficient variety,
discretion, challenge and latitude for using one's own skills and abilities, the employee assigned the job is likely to experience job satisfaction. Therefore, employees need to be assigned jobs which they can be identified with, which demonstrates that they are valued assets to the organisation.

Feedback refers to the degree to which the employee receives information about the efficacy of the performance. This is not only limited to supervisory feedback, but also the ability to observe the effects of one's own work (Vanden Berghe, 2011). Employees prefer a job that is mentally stimulating in that it affords them with opportunities to use their expertise and abilities and offers a variety of tasks, freedom and feedback on how well they are doing. The formation of precise goals, feedback on advancement towards these goals, and reinforcement of desired behaviour will arouse motivation. The fewer, ambiguities, distortions and inconsistencies that occur in communication within the organisation, the more satisfied employees will feel regarding their work (Lumley et al., 2011). Feedback may be in the form of compliment for the good work which leads to increased motivation and job satisfaction. It may also come as information for the need to improve on certain aspects, which the employee will work on in order to be more effective. When an employee is acknowledged for a task well done it makes them feel important and gives them a sense of self actualisation. This may be the same with feedback which is provided to the employees usually by their superiors (Mhlanga, 2012).

Autonomy is the extent in which the employee is free to schedule the pace of their work and define the procedures to be used (Vanden Berghe, 2011). According to Buys et al., (2007), job autonomy is when a jobholder is afforded the power and freedom to exercise his/her own authority while making a decision. Autonomy gives rise to feelings of accountability and responsibility. When an employee is given power to make decisions on their own they are most satisfied as they consider themselves as valuable to the organisation.

Hackman and Oldham's model maintains that attention to these five job features produces three important psychological states, i.e. 1. Meaningfulness of work: for example, teachers may experience meaningfulness of work even in challenging working conditions, because of
the belief that their efforts make a difference in the lives of their pupils; 2. Experienced responsibility for outcomes of work: job efforts are observed as causally associated with the end results of the work, and 3. Knowledge of the real results of work activities: this can be qualified as feedback. The jobholder is able to judge the quality of their performance (Vanden Berghe, 2011).

In his Range of Affect theory, Locke (1976), asserts that job satisfaction determined through a difference which exist between what an employee wants from a job and what the employee is getting from the job. A miniscule difference sets out job satisfaction as being high and a huge difference would mean the employee is less satisfied with the job. Furthermore, this theory also affirms that employees give priority to one facet of the job. This prioritization is different for every individual employee. For example, one employee may value good working conditions more than anything at work, for another employee challenging work might be more important compared to working conditions. The absence of the facet will lead to job dissatisfaction of the employee. Hence, to guarantee job satisfaction, we have to identify the most important facet of the job that an employee wants and ensure this facet is met suitably (Lamley et al., 2011).

2.3.2. Job satisfaction as a function of other people
Salancik and Pfeffer (1978) came up with what they called the social information processing model. According to this model, job satisfaction is subject to the influence of others in the work place. Employees are likely to observe and replicate the attitudes and behaviours of coworkers with similar occupations and interests and of seniors who are regarded as influential and successful (Vanden Berghe, 2011).

Furthermore, Griffin’s and Bateman’s (1986) study in this field found that there was a strong, positive correlation between behaviour displayed by leaders and job satisfaction. Similarly, Agbo et al. (1993) found that perceptions of distributive justice—the seeming level of evenhandedness in distributing rewards in an organisation had an effect on job satisfaction (Vanden Berghe, 2011).
2.3.3. Job satisfaction as a function of personal dispositions

The notion of personal disposition covers a wide range of facets, which are not necessarily relevant to the subject of job satisfaction. Therefore, for the purposes of this study, we will try to deal with the most essential personal dispositions:

➢ Affective disposition

Affective disposition, which is the tendency to have positive or negative thoughts and emotions, has a significant impact on one's subjective well-being. Subjective well-being in turn and the resultant affective disposition has a significant impact on job satisfaction and so does job satisfaction on one's subjective well-being. Although job characteristics are important determinants for job satisfaction, they cannot be more important than an individual's subjective well-being (Vanden Berghe, 2011).

This means that, besides the nature of the job itself, the affective disposition of an employee is a key determinant for job satisfaction. It can also be concluded that job satisfaction influences one's overall satisfaction. This infers that an employee who is not satisfied with his or her job, but absolutely satisfied with his or her life, may perform very well on the job. Also, an employee who is absolutely satisfied with his or her job, but totally dissatisfied with his or her life, may perform badly on the job (Vanden Berghe, 2011).

➢ Gender

Lefkowitz, (1994), cited in Vanden Berghe, (2011), did an analysis of a number of studies and concluded that women's job satisfaction is on average lower than that of men. One reason for this phenomenon could be that on average women are less invested in their jobs, since their incomes are, or at least considered to be, merely the additional income in the household. Another, more likely, reason why women experience less job satisfaction is that they tend to have less attractive jobs on average compared to men. Lefkowitz's follow-up study confirmed this conclusion by proving that the differences between women and men in the level of job satisfaction vanished when variables such as income, age, education and status were kept equal between women and men (Vanden Berghe, 2011). Magoc (2013) argues that the associations among demoralization, quality of work and job satisfaction are far stronger for men than women, which explains the interaction of demoralization with gender.
According to Mckenna (2000), job satisfaction tends to increase during the course of working life. Several reasons are advanced for that:

i. older employees have better jobs than younger employees, because, owing to a longer career, they had more opportunities to acquire a desirable job;
ii. older people have lowered their expectations over the years;
iii. the older generation has always been more satisfied;
iv. older people who are dissatisfied are more likely to resort to early retirement, while the satisfied older people are remaining in their jobs. This results in a skewed image of the level of job satisfaction among older employees by cancelling out the dissatisfied cohort.

According to Besen et al. (2013), employees of different ages may have diverse needs at work, even when the job is the same, suggesting that for younger employees, providing jobs that give workers the opportunity to use a wide range of skills, to have control over their work and to develop friendships at work, may enhance job satisfaction. While variety, autonomy and friendship tend to be more important to job satisfaction for young adults, older workers, on the other hand, tend to attach more importance on feedback and task significance. The study also concluded that older employees have higher job satisfaction levels overall.

2.4. Dimensions of Organisational Commitment

Allen and Meyer (1990) devised a three-component conceptualization of organisational commitment, namely: (a) affective or attitudinal commitment; (b) continuance or behavioural commitment and (c) normative commitment (Mohamed & Anisa, 2012).

(a) Affective commitment

Affective commitment refers to the sense of affection and feeling of connection to the organization and is associated with work experiences, organizational structures and individual traits (Mohamed & Anisa, 2012). Affective commitment is a positive affection towards the organisation, which is demonstrated in a desire to see the organisation thrive and a feeling of pride at being associated with the organization (Cohen, 2003). Individuals with strong affective commitment continue working for the organisation eagerly and voluntarily not only because they need the job, but because they want to work in this type of
commitment, the employee and the organisation share common values and as a result there is a positive interaction between them (Meyer, Allen & Smith, 1993).

(b) Continuance Commitment
Continuance commitment refers to mindfulness of the costs involved in parting with the organization or job. Employees with high level of continuance commitment stay with the organization as they are mindful of the need, risks, sacrifices and low possibilities associated with leaving the organization (Mohamed & Anisa, 2012). This has to do with one's experiences and what he/she has given to the organisation. A person with this type of commitment finds it hard to leave his organisation because of the fear of the unknown or having limited or no alternatives. Employees with high level of continuance commitment therefore stay in the organisation because they need it (Nagar, 2012).

(c) Normative Commitment
Normative commitment refers to a sense of obligation to continue employment. Employees with high levels of normative commitment consider that they have to stay in the organization or job as they feel it is right to do so. Normative commitment is the extent to which a person is psychologically connected to the organization through internalization of its vision, goals, objectives, principles, missions and values (Mohamed & Anisa, 2012). Normative commitment can grow when an employee feels beholden to his organisation for having invested its resources and time on him and feels obligated to repay for all the benefits that he gets from the organisation by putting effort on his job and staying in the job (Nagar, 2012).

2.5. Review of relevant literature
This part deals with the body of literature including relevant concepts and constructs by different scholars on job satisfaction and organisational commitment. The aim is try and understand different factors that are likely to have an impact the employees' job satisfaction and organisational commitment.
2.5.1. Job satisfaction

2.5.1.1. Introduction

Job satisfaction is a critical preoccupation for all organizations whether they operate in public or private space or working in advanced or developing countries. The primary reason for this degree of interest is that a satisfied workforce is reported to be committed, and commitment is an indication for organizational productivity and efficient operations (Rehman et al., 2013). Several studies of behaviours within organizational setting have highlighted important variables that are supportive or unfavourable to the performance of the workforce. This idea holds true when one focuses on the quality of human resources which is a major factor which contributes significantly to the success of any organization. (Malik et al., 2010).

There is no doubt that the most valuable asset of any country is its teachers. Teachers are regarded as the builders of a nation. There is consensus about the fact that all other factors are meaningless without the existence of committed and effective teachers (Rehman et al., 2013). Understanding of how teachers become committed and satisfied with their work, and to what extent various factors contribute to their level of commitment, is really critical to enhancing their performance (Malik et al., 2010).

2.5.1.2. Dimensions of Job Satisfaction

Locke (1976) presented a number of job dimensions that have been established to contribute considerably to employees’ job satisfaction. Such dimensions represent attributes associated with job satisfaction. The dimensions include, among others, pay, promotion, supervision and co-workers (Mhlanga, 2012).

Remuneration (Pay)

Remuneration is the payment for work done and can take a number of different forms, including a basic salary, additional cash payments, such as overtime pay, and benefits in kind (Heery & Noon, 2001). According to Mhlanga (2012: 28), remuneration is defined as “the financial and non-financial extrinsic rewards offered by an employer for the skills, time and effort provided by the employee in satisfying job requirements for the fulfilment of organisational objectives.”
Salaries do not only help people to acquire their basic necessities, but it is also essential in sustaining the higher level needs of people. Compensation includes items such as medical aid schemes, paid leave, pension schemes, bonuses and travel allowances (Lulhans, 1998). Offering employees reasonable and fair compensation, which is commensurate to the input the employee makes to the organisation, should be the key objective of any compensation regime. This means that for employees to regard their remuneration to be fair and reasonable it must relate to the input they make to the organisation (Mhlanga, 2012). According to Robbins et al. (2003) argue that employees want pay systems that are considered to be fair, unambiguous, and consistent with their expectations. When remuneration is perceived to be reasonable, is proportionate to the demands of the job, the employee’s skill level, and community pay levels, satisfaction is likely to be the result.

A study conducted by Voydanoff (1990), in the public sector managers, found that salary levels affect job satisfaction, and that those public sector employees that compared their salaries with those in the private sector had lower levels of job satisfaction. This shows that another way employees gauge if their remuneration is fair is by comparing it to other employees on the same rank. This leads to job dissatisfaction, if employees find that their organisation is paying them poorly in comparison to other organizations’ employees.

Promotions

Hecry and Noon (2001), define promotion as the act of moving an individual up the organisational hierarchy, often leading to an increase in status and responsibility and a better remuneration package.

Promotion provides an employee with opportunities for personal growth, added responsibilities and improved social status. Job satisfaction is more likely to be experienced by employees who perceive opportunities for promotion to be fair (Robbins, 1993). Promotions afford employees opportunities for growth and increased accountability on the new position. Opportunities for promotion are also likely to have a positive influence on job satisfaction (Mhlanga, 2012).

When opportunities for promotion are provided, employees’ levels of satisfaction will improve as they know that there is room for individual growth and self-actualization. This
may lead to opportunities for growth and advancement in their current work, or improve the chance of finding alternative employment. Therefore, if employees feel they have restricted career advancement opportunities, their job satisfaction may decrease. The likelihood that employees will be promoted and the fairness of such promotions have an impact on job satisfaction (Drafke & Kossen, 2002).

Employees seek fair and just promotion practices and policies. Employees who observe that decisions regarding promotions are made in a fair and just manner are more likely to be satisfied with their jobs. Fair and just promotion policies and practices are a foundation for growth in any organization. When an employee is promoted fairly, based on his true assessment, he/she gets a type of recognition, and hence, it increases his/her job satisfaction (Witt & Nyc, 1992). A study conducted by Kalleberg and Mastekaasa (2001) found that promotions improve employees' perceptions of the quality of their job and thereby increase both their commitment and satisfaction.

Tolbert (1996) asserts that opportunities for promotion have different effects on job satisfaction because of their differing forms and an array of accompanying rewards, and the most preferred forms of promotion are by performance and seniority. Promotion through seniority often leads to job satisfaction, but not as much as promotions through performance (Mhlenga, 2012).

Co-workers

Research has pointed out that job satisfaction is subject to the influence of others in the work place. Employees are inclined to notice and replicate the behaviours and attitudes of colleagues with comparable jobs and interests, and of superiors who are considered to be successful and powerful (Vanden Berghe, 2011). Ghazzawi, (2008) argues that an employee's co-workers, the groups they associate with, and the culture to which an employee is exposed, are all likely to influence job satisfaction.

An employee's level of job satisfaction might be a function of personal attributes and the features of the group to which they belong. The social situation of work is also likely to have a major impact on an employee's attitude and behaviour. Employees' relationships with the supervisor and co-workers has an effect on individual job satisfaction. If a worker does not
fear welcome among colleagues, it may lead to dissatisfaction with their jobs. Employees get more out of work than just money or tangible accomplishments. For many employees, work also satisfies the need for social interaction. Therefore, having friendly and supportive colleagues improves job satisfaction (Mhlanga, 2012).

It is, however, worth mentioning that although studies have undoubtedly established that the influence of others in the workplace on job satisfaction is substantial; not everyone is equally susceptible to the influence of others. There are individual differences which can be ascribed to differences in personal dispositions (Vanden Berghe, 2011).

> Supervision

Supervision plays a vital role in relation to job satisfaction in terms of the aptitude of the supervisor to provide technical and emotional support and guidance in work-related tasks (Robbins et al., 2003). Managerial ineptitude is devastating to employee job satisfaction and engagement, and contributes significantly to employee burnout. Bad managers cause misery among subordinates and contribute to major losses for organisations. Improved organizational efficiency is attainable by identifying and adapting managerial strengths and dysfunctional dispositions that influence employee job satisfaction and engagement (Leary et al., 2013).

Dysfunctional leadership behaviours are not always overt and active (e.g., shouting and direct confrontation), but can also be passive, covert, and indirect (e.g., procrastination, not meeting deadlines and non-specific directives). Passively destructive leadership can be exemplified by both passive avoidance and passive aggression. Passive avoidance can be characterized by aloofness, insensitivity, and detachment, while passive aggression can be characterized by rudeness, procrastination, and failure to set expectations (Leary et al., 2013).

Job satisfaction increases when one's immediate supervisor is friendly, understanding, listens to employees' views, offers compliment for good performance and shows keen personal interest in them. Employees prefer a job that is mentally stimulating in that it affords them with opportunities to use their skills, talents and abilities and offers a multiplicity of tasks, freedom and feedback on how well they are doing (Lumley et al., 2011).
Employees may have high levels of job satisfaction if their immediate supervisors are understanding, supportive and cooperative, provide constructive feedback and have good communication skills. A bad relationship between an employee and a supervisor results in dissatisfaction with work (Mhianga, 2012).

2.5.1.3 Job Satisfaction and the Quality of Work Life (QWL)

Quality of work life (QWL), deals with both the intrinsic and extrinsic facets of jobs. It is a philosophy, a set of values, which holds that people are the most essential resource in the organisation as they are dependable, responsible and capable of making valuable contribution and they should be treated with respect and dignity. QWL includes type of wages payment, working time, working conditions, health hazards issue, financial and non-financial benefits and management behaviour towards employees (Vasita & Prajapati, 2014).

The emphasis placed on the non-financial benefits and management behaviour, is in line with Hackman and Oldham’s (1975) Job Characteristic Model, in which they identified five central dimensions for assessing the immediate work environment. They argue that any job can be assessed for its motivating potential by making use of five dimensions, namely: skill variety, task identity, task significance, autonomy and feedback (Vanden Berghe, 2011).

The frustration, boredom and anger common to employees dissatisfied with the quality of work life can be costly to the individual as well as the organisation. Thus, quality of work life stimulates the employee job satisfaction and is vital for enhancing operational and organisational productivity. Employees who are afforded a high QWL, are more effective and productive. Moreover, QWL has positive influence on human outcomes and it considerably reduces absenteeism, grievances, minor accidents and employee turnover. High QWL is also critical for organisations to continuously attract and retain best employees (Vasita & Prajapati, 2014). A job is an essential component of life, where a number of factors affect community. Work life is one of the important parts of our everyday life which gives rise to a great deal of pressure if an employee is unhappy with his/her work (Rehman et al., 2013).
2.5.1.4 Job Satisfaction and Person-Organisation fit (POF)

The notion of Person-Organisation Fit (POF) deals with the resemblance or congruence between the employee’s own personal values and the values of the organisation, according to the employee’s perception.

Person-Organisation fit has a significant effect on job satisfaction. Job satisfaction is powerfully motivated by employees’ valuation of the job and assignments they perform, which are the important components of Person-Job fit. Most researchers over the years have concluded that Person-Organisation fit and Person-Job fit should correlate to evaluate job satisfaction since both variables have strong impact on job satisfaction and job performance (Farooqui & Nagendra 2014).

While the correlation between job satisfaction and performance is also positive, Person-Organisation fit is a significant antecedent of performance. Job performance of employees is critical in determining an organisation performance. Logic dictates that the better an employee is suited to his job, the less fine-tuning he will have to do (Roberts & Robins 2004).

Farooqui & Nagendra (2014) further argue that Human Resource Management should assist in obtaining maximum employee development, ensure meaningful working connection between employers and employees, employees and employers, and necessary moulding of human resources. Such an understanding should also inform the organisation’s policies on selection, recruitment, development, motivation and compensation of human resources.

Humans are generally recognized as the most important assets of the organizations. Organisations need humans as strategic instruments of competence. To get the best performance out of human resource it is vital to give them the assignment that is best suited to their proficiencies and efforts (Farooqui & Nagendra 2014).
2.6. Organisational Commitment

2.6.1. Introduction
The concept of organisational commitment has attracted a great deal of attention in the human resource management and psychology literatures. As a result, employee commitment and loyalty are fundamental attributes in the high performance workplace literature where they are regarded as prime factors linking different types of human resource management and workplace practices to improved performance (Brown et al. 2011).

2.6.2. Antecedents of Organisational Commitment
There are many factors that are said to have an influence on organisational commitment, but for the purposes of this study, I deal with a few:

➤ Job characteristics
Job characteristics variables cover broad measures of job scope, challenge, or motivating potential to definite measures like feedback, task identity, autonomy and responsibility (Paul 2004). Hackman and Oldham’s (1976) job features model maintains that enriched jobs are highly likely to yield higher levels of organisational commitment (Paul 2004). Autonomy refers to the extent of latitude an employee can exercise on the job. There is a low positive relationship between autonomy and organisational commitment (Still 1983). Procedural fairness, work life policy practice and information sharing must be regarded as balancing means to achieve lower turnover rates. Professionals stay in organisations where work is stimulating and demanding, and where possibilities for progress are high (Rehman et al. 2013).

➤ Group Leader Relations
According to Paul, (2004), if a supervisor provides more timely and accurate types of communication the work environment is enhanced and this is likely to boost employees’ organisational commitment.

Further, Gaertner and Nollen, (1989) assert that the degree of employee commitment to organisational goals and values can be significantly influenced by group leader relations. They also argue that the more participative and flexible management styles can positively and
strongly enhance organisational commitment, and that these styles tend to decrease the levels of stress among employees.

Promotions
Satisfaction, promotions, and organisational identification are the strongest forecasters of organisational commitment. Therefore, providing structured progression, development and job security, and meeting uncertainty avoidance needs of employees become crucial. Therefore, organisations may re-examine their policies related to enhancing commitment by embarking on strategies such as rapid promotions, participative work culture and pension plans for improving employee organisational commitment (Nagar 2012).

Adams, (1965) in his Equity Theory, asserts that it is more likely that when employees regard an organisation to be unsupportive and unfair in their treatment, mainly with regard to the accessibility and regularity of promotional opportunities, their organisational commitment will not be high. According to Suman & Lesha, (2013), the lack of satisfaction with promotion, and the strong positive relationship between promotion and organisational commitment, means that improving this aspect would lead to an enhancement of organisational commitment.

Role Characteristics
Mowday et al. (1982) proposed role characteristics as made up of role conflict, role ambiguity and role overload, and argue that role characteristics result from employees’ perceptions of the work environment and have an influence on affective responses, and that employees who report higher levels of role strain tend to report lower levels of organisational commitment.

2.7. Job Satisfaction and Organisational Commitment
Most scholars have come to a consensus on the existence of a strong positive relationship between job satisfaction and organisational commitment, as well as between organisational commitment and other desirable work outcomes such as performance and adaptability. Satisfied employees generally tend to be loyal to an organisation, and employees who are committed and satisfied are more likely to stay with an organisation, attend work, arrive on time, give good performance and engage in behaviour supportive to the organisation (Lumley et al. 2011).
Employee commitment and loyalty are clearly associated with greater levels of workplace performance. It is therefore in any organisation's interest to foster such attachments with its employees. The analysis of the contributory factors to employee attitudes suggests not only a role for worker attributes, but also for workplace features, particularly human resource practices and building employee trust in the organisation, in inducing such attachments. This suggests that organisations may be able to apply some control over the commitment and loyalty of its employees, which, in turn, may boost organisational performance (Brown et al. 2011). High job satisfaction contributes considerably towards an increase in organizational commitment (Nagar 2012).

Organisational commitment is most probably affected by factors such as type and variety of work, the autonomy involved in the job, the level of responsibility associated with the job, the quality of the social relationship at work, rewards and remuneration, and the opportunities for promotion and career advancement in the company (Riggio 2009).

The teachers' satisfaction with their jobs may have critical implications for their emotional attachment to the organization. Such attachment or organisational commitment is indispensable for attracting and retaining suitably qualified personnel as turnover costs to organisations can be very high (Nagar 2012).

Organisational commitment is less determined by daily events compared to job satisfaction. It develops consistently and slowly over time, and therefore, is understood to be a more complex and enduring construct (Suma & Lesha, 2013). Moreover, organisational commitment and job satisfaction do not necessarily happen simultaneously; an employee may display high levels of job satisfaction without feeling a sense of affection to, or obligation to stay in the organisation. Likewise, a highly committed employee may exhibit low levels of job satisfaction (Suma & Lesha 2013).

2.8. Job Satisfaction and Organisational Productivity

It is vital for administrators and managers in organisations to ensure a work environment that promotes higher levels of employee satisfaction. The reason for this is that employee satisfaction has a stimulus consequence on the confidence and loyalty of employees, increases productivity and also improves the quality of outputs (Mafini & Pooe 2013).
On the overall, job satisfaction has a positive impact on organisational performance in any public organisation. When employee satisfaction is expedited and optimised, it acts as an incentive to improve organisational performance. In contrast, organisational performance diminishes when employees are dissatisfied. Satisfied employees are inclined to perceive that the organisation will be more satisfying in the long run, they are serious about the quality of their work and tend to be more committed to the organisation, resulting in a demonstration of organisational citizenship behaviours. They also have higher retention rates and are more productive (Mafini & Pooc, 2013).

When employees are dissatisfied with their jobs, their mental and physical health is adversely affected (Faragher, Cass & Cooper 2005). As a result, organisational performance will also decline as more production time will be lost since dissatisfied employees tend to take more leave (Judge, Piccolo, Podsakoff, Shaw & Rich, 2010; Shields, 2006, cited in Mafini & Pooc, 2013); therefore, if appropriate steps are undertaken to improve employee satisfaction, overall success of the organisation is improved and the results can be echoed through happier employees and improved workforce productivity. This also illustrates the importance of people in any organisation, since people are the agents of exceptional organisational performance (Mafini & Pooc, 2013).

2.9. Advantages of Organisational Commitment

A highly committed employee is inclined to identify with the values and the goals of the organisation, has a strong willingness to belong to the organisation, is prepared to demonstrate high levels of organisational citizenship behaviour, i.e. a preparedness to go beyond and over their specified and required job duties (Luxmi & Yadav 2011). Work units comprising of employees that, on average, report higher levels of organisational commitment, perform better in terms of performance quantity and quality (Conway & Briner 2012).

Organisational commitment is generally associated with diminishing abandonment tendencies, which include late-coming and turnover. Furthermore, an employee who is committed to his/her organisation may be more prepared to participate in ‘extra-role’ activities, like being innovative or creative, which often guarantee an organisation's competitiveness (Lumley et al. 2011).
Organizational commitment is vital for attracting and retaining well qualified employees as only satisfied and committed employees will be keen to continue their relationship with the organization and make significant effort towards attaining its goals (Nagar 2012). Teachers who are highly committed are self-motivated and truthful in whatever they involve themselves (Nagar 2012).

Normative commitment increases when an employee feels indebted to his/her organization for having invested its resources and time on him/her and feels responsible to pay back for the benefits that he/she receives from the organization by staying in the job and putting effort on it (Meyer et al. 1993).

Furthermore, employees with high affective commitment show more readiness to perform Organisational Citizenship Behaviour (OCB), as opposed to other employees who are not affectively committed. Organisational Citizenship Behaviours are highly treasured workplace behaviours exhibited or performed by an employee that is optional, not directly or clearly stipulated by scope of job descriptions, or official remuneration arrangement, and in total promote the efficient and effective running of the organisation. It is the behaviour demonstrated by the employees when their expectancy of formal organisational rewards for their task is less (Mohamed & Anisa 2012).

Organ (1990) described five types of OCB:

- Conscientiousness means that employees perform job behaviours beyond the minimum required levels;
- Altruism means that the employees are always willing to help others working with them;
- Civic virtue suggests that employees prudently take part in the political life of the organization;
- Sportsmanship suggests that employees do not criticize but have constructive and positive attitudes; and
- Courtesy denotes that the employees value their co-workers and treat them with admiration, respect and esteem.
2.10. Conclusion

This chapter examined the different theoretical approaches to the concepts of job satisfaction and organisational commitment as well as the review of relevant literature by various scholars pertaining to factors that impact on employees' job satisfaction, productivity and organisational commitment. The aim was to ascertain the impact of such factors on the teachers' attitudes towards their jobs and the resultant impact on the overall quality of education. The next chapter focuses on the research methodology that was employed in the study.
Chapter Three
Research Design and Methodology

3.1 Introduction

The previous chapter examined different theoretical approaches to the concepts of job satisfaction and organisational commitment as well as the current and pertinent debates in related literature regarding factors that impact on employee job satisfaction, productivity and organisational commitment. This chapter focuses on methodology and research design employed in this study. It focuses on the paradigmatic positioning of the research study and sampling methods that were chosen to generate data for the study. This study is located in the interpretative paradigm using the qualitative approach. The interpretative paradigm offers a perspective of a situation and gives insight in the way participants make sense of their situation (Maroco, 2007). The chapter finally examines the ethical issues, validity, reliability, trustworthiness and limitations of the study.

3.2 The Aim and Objectives of the Study

The aim of the study was to analytically evaluate teachers' perceptions and attitudes towards their jobs. In short, the study sought to answer the following questions:

(a) How does job satisfaction, loyalty and organisational commitment affect the productivity and job performance of teachers in Illembe District?

(b) What are the factors for the perceived lack of job satisfaction, and organisational commitment among teachers in Illembe District?

(c) What contribution do different stakeholders make to improve job satisfaction and organisational commitment among teachers in Illembe District?

Because of the broad nature of the topics covered, the researcher decided to confine the study to the following aspects: the nature of the job, supervision, resources, remuneration and opportunities for development and promotion.
3.3 Methodology

This study employed a qualitative research method. The researcher chose the qualitative approach because of its open and involved nature. Qualitative research provides the flexibility to explore and deal with unknown nuances of the matter being studied. It is not restricted by rigid notions about the topic being interrogated (Flick et al. 2004).

In distinguishing between qualitative and quantitative research, Creswell (2012) asserts that qualitative research is the best approach if a research problem needs quantifiable variables, weighing the effect of these variables on the findings or if the findings need to be applied to a large population.

Quantitative research relies on a randomly selected sample to examine a specific variable using statistics and numbers. Data collection is done with controlled instruments. It aims to be objective in testing a specific hypothesis. This eliminates room for any researcher bias. Statistical analysis is used to present results, mean data, correlations and other statistically significant results (Sekaran & Bougie 2009).

Qualitative research, in contrast, is best suited when a research problem requires that the researcher learns and understands the views of individuals or acquire comprehensive data about a few people or research site (Creswell 2012). Qualitative research seeks to make sense of important details within a social context, by providing detailed descriptions. Qualitative research allows for the understanding of any phenomenon through the eyes of the respondent (du Plooy-Cilliers, Davis & Bezuidenhout, 2014). Though reliant on a smaller sample, qualitative research is involved and open in its approach. The findings of qualitative research are highly descriptive. Qualitative research, by its nature, provides the latitude to deal with and explore unknown nuances of the matter being studied. It is not restricted by predetermined concepts about the subject being researched (Seedat-Moola 2014). Qualitative research can capture qualities that trigger subjective experiences, and, the repercussions of these qualities. Therefore, the researcher’s objective, is to select a method suitable to gathering rich and deep data (du Plooy-Cilliers et al. 2014). Qualitative research is a form of “interpretative inquiry” where the researcher interprets what they “see, hear and understand”, as opposed to quantitative research where the focus is on “surveys and experimental designs” (Creswell 2009: 145).
### Table 3.1: The difference between qualitative and quantitative approaches

<table>
<thead>
<tr>
<th>Qualitative Approach</th>
<th>Quantitative Approach</th>
</tr>
</thead>
<tbody>
<tr>
<td>The emphasis is on understanding</td>
<td>The emphasis is on testing and verification</td>
</tr>
<tr>
<td>The focus is on understanding from the respondents' point of view</td>
<td>The focus is on facts and/or reasons for social events</td>
</tr>
<tr>
<td>Employs interpretative and rational approach</td>
<td>Uses logical and critical approach</td>
</tr>
<tr>
<td>Observations and measurements done in natural settings</td>
<td>Relies on controlled measurement</td>

### 3.4 Sampling and Sample Size

According to du Plooy-Cilliers et al. (2014), a sample is a section of a population that is regarded to be representative of a particular population. In quantitative research, a sample is relied upon to generalise particular features of an entire population by examining those specific features in a representative sub-group of that population (Sekaran & Bougie 2009). Researchers rely on sampling since it is impractical to study an entire population i.e. because it is costly and time consuming, analysing an entire population could lead to human error and exhaustion when assembling and analysing data (Sekaran & Bougie 2009).

Probability and non-probability sampling are the two most frequently used types of sampling. Probability sampling ensures that each unit in the population has an equal chance of being nominated for the sample, whereas in nonprobability designs there is no probability of being selected that is attached to the elements of the population (Sekaran & Bougie 2009). Probability sampling is most preferred where the research requires a sample that is randomly selected, is not determined by the researcher, fits within the common features of the study...
and leads to results that can be generalised over the total population (du-Plooy-Gilliers et al. 2014). Probability sampling is appropriate for a quantitative study and not for a qualitative study (Sekaran & Bougie, 2009).

Non-probability sampling is further divided into two broad categories, namely, convenience sampling and purposive sampling. Convenience sampling entails the collection of data from sample of the population that is readily available to provide it. Purposive sampling, by contrast, targets specific types of individuals who can provide the required information, either for the reason that they are the only ones who have it or that they conform to specific criteria determined by the researcher (Sekaran & Bougie 2009).

This study used purposive sampling approach where six secondary schools were selected in Umzimkhulu District of the KwaZulu-Natal Department of Education. Umzimkhulu District services predominantly rural schools with a few urban and semi-urban schools. According to Creswell (2012), in purposive sampling the researcher purposely chooses people and sites to understand the central phenomenon. There were three key units of analysis for this study, namely, school principals, HODs and post-level 1 educators. These were further classified according to the social backgrounds of the respective schools. Two secondary schools were sampled from the urban, quintile three schools. The second pair of schools was selected from the semi-rural, quintile two schools. The third pair was selected from the rural, quintile one schools. This was to ensure that responses would be a fair reflection of teachers' lived experiences from different economic and social backgrounds. In total six principals, four HODs and six post level 1 educators participated in the study. The reason for fewer HODs is that the sampled quintile one schools were low enrolment schools that did not qualify for an HOD. A similar one-on-one open-ended interview schedule was used for the principals, the HODs and post level 1 educators alike. Respondents were expected to respond based on their lived experiences and their specific job descriptions.
3.5 Data Collection Process

One-on-one open-ended interviews (Appendix A, p. 67) were conducted with all participants. Interviews are a two-way conversation in which questions are asked for the purpose of gathering information about the ideas, beliefs, opinions, views and the behaviour of the respondent (Maree 2012). Interviews allow for flexibility in the data gathering process (Cohen et al. 2011). Open-ended interviews take the form of the discussion between the interviewer and the interviewee (Maree 2012). This method also allows the researcher to ask the respondents the same essential questions in exactly the same order, thus improving the comparability of the responses (Cohen et al. 2011).

All interviews were conducted face-to-face in order to allow for a free flow of communication between the interviewer and the respondents. This approach is best when dealing with a small number of respondents as it allows the interviewer to gain perfect perspectives and insights of the respondents. (Creswell 2009). The interviews were audio-recorded after attaining consent of the respondents.
3.6 The Pilot Study

Questionnaires can be very tricky to formulate and administer. Defective administration of the questionnaire can lead to uninterpretable data or may result in low respondent returns. A questionnaire should inspire people to co-operate and also produce responses that the researcher can use to construe the results of a study. A questionnaire must therefore be clear, simple and brief (Leedy & Ormrod 2010).

Piloting questions on a few individuals can help in testing the instrument of research in order to gain clarity. It further helps to eliminate redundant questions and ensure the easy flow of the subsequent interviews (Wilkinson & Birmingham 2003). The researcher piloted the interview guide with his colleagues who are Senior Education Specialists in Ilembe district of the KwaZulu-Natal Department of Education where he works. The exercise proved to be very helpful and an eye-opener, which resulted in some of the questions having to be re-phrased and some eliminated.

The researcher ensured that he only solicited information that was essential for the research project. The questions were formulated using terms that the respondents were familiar with. Lengthy and complicated items were avoided as they might have been difficult to comprehend. The researcher tried to pay particular attention to the language and the wording of the questions. The intention was to avoid leading, ambiguous, loaded and double-barrelled questions. The interview schedule was thoroughly checked to ascertain that there was a connection between the research questions, the problem statement and the objectives of the study.

3.7 Validity, Reliability and Trustworthiness

According to Leedy and Ormrod (2010), the validity of any measurement instrument is the degree in which the instrument measures what it was intended to measure. Simply put, validity is about whether or not the researcher measures what they set out to measure in the first instance and the effectiveness of the measurement. Sekaran & Bougie (2009) concur that validity determines if the instrument is truly measuring what it intended to measure, and that validity and reliability concepts are most often used to determine the quality of the study. To this end, the researcher ensured that the aims and objectives of the study were measured against the results of the study.
Reliability shows to what degree the measurement instrument is precise, free from prejudice, and will constantly yield similar outcomes if used by another researcher (Sekaran & Bougie, 2009). Du-Plooy et al. (2014), further contend that the concepts of validity and reliability are more suitable for quantitative research where the objective is to determine causal relationships and generalise to a bigger population.

Qualitative research seeks to gain a thorough understanding of a phenomenon, consequently the concept of trustworthiness is a better measure of the tool used for this type of study (du-Plooy et al., 2014). Trustworthiness is further divided into the following concepts (du-Plooy et al., 2014):

a) Transferability
This refers the extent to which the conclusions of a particular qualitative study can be applied to other studies and presents a measure of generalisation to a research method that does not emphasise generalisability (du-Plooy et al., 2014).

b) Credibility
This is the level of accuracy with which the researcher interpreted the data collected. Credibility is enhanced if the researcher spends a substantial amount of time with respondents to get a better and deeper understanding of their lives. This can include the use of more than one data collection method, which is referred to as triangulation. A good measure of credibility is the extent to which the respondents find the researcher's data analysis to be believable (Leedy & Ormrod, 2010).

c) Dependability
This refers to the level of accuracy with which the data collection method, the analysis of the data and the conclusions are meaningfully integrated (du-Plooy et al., 2014). In this study, thematic data analysis was used to ensure good integration and to enhance meaningfulness.

d) Confirmability
This is the extent to which the findings of the research are corroborated by the data that was collected (Leedy & Ormrod, 2010). In this study, each finding is supported by concrete data collected from the respondents.
Trustworthiness is absolutely essential to guarantee a meaningful contribution to the body of knowledge (du-Ploooy et al., 2014).

3.8 Data Analysis
Qualitative data analysis necessitates the classification of things, persons, and events into specific themes in order to make data analysis easier (Creswell, 2009). Ideas are classified according to similarity, and similarity therefore, plays a substantial role before an idea is developed (Froehlich, 2012). During the data analysis stage, after the interviews had been concluded, they were transcribed precisely as they had been recorded and checked for correctness by the researcher. The transcriptions were studied several times to comprehend the data (Creswell, 2009). The researcher then looked for common themes, topics related to the study, patterns and events to make sense, clarify and interpret these results. Thematic analysis was then used to interpret data, which involved a process of grouping responses into specific themes to derive patterns from the responses provided. Data was then analysed according to themes and sub-themes in order to identify ideas that were comparable, and to identify new opinions that emerged from the study. By relying on interrelating descriptions and themes the researcher interpreted the meaning of the data and documented this in the study (Creswell, 2009).

3.9 Ethical Considerations

The requirement to address ethical issues is of paramount importance in the process of conducting research (Creswell, 2012). According to Rule and John (2011), ethical considerations are based on three basic principles in research: autonomy, beneficence and non-maleficence. The principle of autonomy entails ensuring that the participants’ self-determination is not in any way compromised by the research (Rule & John, 2011). This means ensuring that the participant’s confidentiality, privacy and anonymity is guaranteed. Firstly, the researcher ensured that ethical clearance to conduct research in schools run by the KwaZulu-Natal Department of Education was sought and granted in writing by the Provincial Head of Department before the commencement of the study (Appendix B, p. 68).

Informed consent was obtained from all participants. Participants were informed in writing and verbally, that they were free to participate and withdraw from the study at any point if they wanted to without being subjected to any punitive measures. Confidentiality was assured by protecting the identities of participants. Pseudonyms were used in the presentation
of data from the participants. The safe-keeping and incineration of the audio material after a five-year period further guaranteed participants' confidentiality.

The principle of beneficence entails ensuring that feedback is provided to interested parties (Rule & John, 2011). Participants were informed of the value of the study and its potential in developing insight into the factors that affect teachers' job satisfaction, organisational commitment and productivity. The potential value of the study in the formulation of educational policies was also discussed with the participants. In addition, a commitment was made to make the final copy of the study available to the participants on request.

The principle of non-maleficence in ethical considerations is about ensuring that no harm is inflicted during all phases of the research process (Rule & John, 2011). The researcher addressed this principle by ensuring that none of the questions or any feature of the study had the potential of causing any harm or injury to any of the participants or any other individual during and after the study.

The researcher also ensured that all the interviews were not conducted during teaching time and that they took place at neutral venues away from the schools. This was to avoid interfering with the schools' academic programmes. This was also to ensure that the researcher's position as Subject Advisor in the Department is clearly distinguishable from his role as researcher in this instance; as Wallace and Sheldon (2015), argue, no research is conducted in a vacuum as there are a whole host of power relationship issues when conducting a study in organisations. Such power relations can relate to hierarchical roles and expectations by participants. It must be said though that this made the task even more difficult and tiresome as the researcher had to find times and venues that were convenient to the respondents.

3.10 Summary

This chapter dealt with the process of conducting the study, the methodology as well as the rationale for the methodology relied upon. The study used a qualitative approach as it was the most appropriate for this type of research. Purposive sampling was used to target individual teachers occupying different positions in the system. The sampled individuals also came from schools that differ in terms of socio-economic backgrounds as well as personnel and learner numbers. The semi-structured interviews were conducted, probing participants on their views
regarding different aspects of their jobs. The chapter also described how the opinions of established scholars were applied to justify the research methods employed in the study to ensure that data collected as well as the conclusions deduced were theoretically sound, relevant, trustworthy, valid and reliable. The next chapter deals with the presentation and discussion of the findings.
CHAPTER FOUR
PRESENTATION AND DISCUSSION OF THE FINDINGS

4.1 Introduction

The previous chapter dealt with research design and methodology employed in the study. It focused on the paradigmatic positioning of the research study and sampling methods that were chosen to generate data for the study. The chapter also examined the ethical issues, trustworthiness, validity, reliability and limitations of the study. In this chapter, the researcher presents and discusses the findings of the study. The chapter also outlines the limitations of the study.

4.2 Demographic information

The interviews were conducted with 16 respondents comprising of school principals, heads of department and post-level 1 educators. Male and female respondents were represented in all the three teacher post categories. The respondents were selected using purposive sampling to ensure that, on the whole, they represent schools from different socio-economic backgrounds. Respondents also represented schools of different staff and enrolment sizes. Schools ranged from a small three-teacher school to a large school with twenty-eight teachers. The smallest school only had a principal and two post-level 1 educators, while the biggest had a principal, a deputy principal, four heads of department (HODs) and twenty-two post-level 1 educators.

4.3 Themes and sub-themes of the study

The following theme and sub-themes emerged from the interviews conducted (see table 4.1 below):

4.3.1. What respondents like about their jobs

According to Richard Hackman and Greg Oldham (1975) in their Job Characteristic Model, one of the dimensions of job satisfaction is task significance. They argued that although job characteristics play an important role in job satisfaction, the knowledge that one’s job makes a meaningful impact in other peoples’ lives can have a satisfying effect (Vanden Berghe 2011).

This came out clearly in the responses of some participants. Although respondents gave varying reasons why they liked their jobs, what was striking though, is that most reasons had to do with the fact that they derived pleasure from seeing the difference that their efforts made in the lives of their learners, rather than the actual nature of their jobs. One respondent had this to say:

“There is nothing more fulfilling and heart-warming to me than to see a learner who has been struggling to put together a meaningful sentence progressing and being able to put together a few sentences into a coherent paragraph. Seeing them gradually improving is absolutely gratifying. It also instills confidence in me as the teacher” (R3).

Another respondent added:
"The knowledge that when I took over as principal six years ago this school had had a string of poor Senior Certificate results, in fact this school was notorious for always being at the bottom of the table of performance; and that we have been able to turn things around to a point where even our enrolment has increased makes me very happy." (R1)

One HOD had this to say about the team of teachers that she supervises:

"The members of my team always praise me for making their lives easy, instead of demanding work without empowering them, we have always worked together to ensure that everyone understands what needs to be done regarding things like planning, compiling a teacher file, assessment, and even subject content. This has resulted in a very healthy working relationship for our team and has made my work enjoyable." (R4)

Of course, there were those who felt that their work gave them more time to spend with families and friends, as one interviewee put it:

"My work may be demanding and somewhat boring because I get to repeat one and same thing year-in and year-out but I like the fact that we have enough holidays at regular intervals ... In fact, even some of my friends with better paying jobs envy teachers for this." (R8)

The nature of their job makes teachers life-long learners themselves, and that is regarded by many as an advantage on its own. They believe that they learn more and remain sharp as they teach others:

"My job has made me a better person ... and more knowledgeable and I learn new things every day. I find it easy to join a discussion on any topic. Teaching has made me a better public speaker as well." (R15)
4.3.2. Job challenges

Respondents came up with a variety of challenges that they face in the execution of their jobs. These ranged from the nature of the job itself, educational policy uncertainty, the work environment, the challenge of the lack of resources and the lack involvement of some important stakeholders in the education system.

4.3.3 The nature of the job

Mowday et al., (1982), proposed role characteristics as made up of role conflict, role ambiguity and role overload. They argue that role characteristics result from employees’ perceptions of the work environment and have an influence on affective responses, and that employees who report higher levels of role strain tend to report lower levels of organisational commitment (Paul, 2004)

Most respondent cited work overload as the main challenge facing teachers. A large amount of paper work that teachers at all levels have to do over and above the actual teaching was cited as the major challenge facing teachers. Such paper work involves planning, the compilation of work schedules, lesson plans, preparing assessment tasks, marking, recording and processing of learner-results. Most teachers felt that such activities take a disproportionate amount of time that they could otherwise be using for delivering lessons.

This is what one respondent had to say:

"Paper work is a major problem which takes far more disproportionate time which one would otherwise dedicate to teaching. I teach three sections of the grade six class with a combined total of two hundred and ten learners. Whenever I set an assessment task I can’t stop thinking about how many hours it would take to mark learner portfolios, record and analyse the results. It’s an absolute torture. This means working long hours into the night in most instances. The sheer number of learners also makes it impossible to give every learner necessary individual attention. If truth be told, sometimes it takes me months before I know every learner by name" (R5)

According to teachers from small-enrolment schools, their situation is even more dire. The number of teachers allocated to each school is determined, in the main, by the number of learners they have. The Department of Basic Education uses what is called the Post-
Provisioning Model (PPM) to determine the number of teacher posts to be allocated to each school. This translates into what is called Post-Provisioning Norm (PPN) for each school. This results in a situation where very small schools end up being allocated very few teachers, sometimes just two or three teachers, including the principal.

This is what a principal of a five-teacher school had to say about her situation:

"My work drives me crazy. I have to perform all my duties as the principal, which includes managing the implementation of the curriculum, worry about the day-to-day running of the school, attend to everyone who visits the school... I also have to teach three classes... When I have to attend meetings or workshops my learners are left stranded with no one to teach them... I also feel for my teachers because I can see they are trying so hard but they are over-stretched. Yes, we have few learners but we still have to offer all the subjects, yet there is no manpower. It's really... really hard" (R13)

Some respondents further lamented the fact in the case of small schools the current post-provisioning model not only makes their work difficult, but also seriously prejudices the learners. They argued that it compromises the quality of education that learners receive.

This is how one respondent put it:

"Because of the shortage of teachers we have had to resort to multi-grade teaching, where you have to teach different grades in the same class at the same time. It becomes so difficult because there is specific content to be taught for different grades even if the subject is the same. Even if you are dealing with the same concept or topic you can't have similar expectations for both grades... You have to pitch your presentation at different levels depending on the grade. This arrangement means that learners are short-changed." (R10)

4.3.4. Resources

The allocation of funds to schools by the Department of Education (DoE) based on the number of learners a school has, seems to be a challenge for schools small-enrolment schools. Principals of small schools, which are predominantly rural, argue that this fund allocation model by DoE results in their schools' allocations being so little that they struggle to pay for basic necessities to run the schools.
This finding is in line with the assertion made by Nagar (2012), that the shortage or non-availability of material resources for teaching can be a source of stress and burnout for education practitioners.

This is what one principal for a small rural school had to say:

"I think there is a serious problem with the allocation of funds for small schools. Because allocations are determined per capita based on learner numbers, small schools get so little yet there are standard costs of running any school regardless of its size. We struggle even to pay for basic maintenance, cleaning of premises and even paying for water and electricity." (R14)

According to some teachers, especially principals, the categorisation of schools into different quintiles from 1 to 5 has not been without its problems. The criteria used to categorise schools considers, among other things, the type of sanitation a school has, whether it has a library and, most importantly, whether people (parents) in the school’s catchment area can afford to pay. A quintile 1 school is considered to be the poorest and most disadvantaged, while a quintile 5 school is considered to be the least poor school. The implication for funding is that the lower the schools’ quintile ranking, the more funding it receives and vice versa.

One principal expressed her frustration:

"My school is quintile two while our neighbouring school, just across the fence is quintile one, as a result they receive the rural allowance while we don’t. It can’t be fair. We are still fighting this matter." (R11)

The determination of fee-paying and no-fee schools has become a bone of contention in some cases. Some schools have met resistance from parents refusing to pay for their children. This is what a principal of a fee-paying school had to say:

"Ours is a fee-paying school, but because our two neighbouring schools are no-fee schools we meet resistance from parents when it comes to the payment of fees."
Parents do not even come forward to apply for exemption, because that is provided for based on the parent's financial situation. Only twenty-one percent of our learners pay. This has led to a situation where we sometimes struggle even to pay for electricity. Sometimes we can't even buy stationery.” (R2)

4.3.5. Parental involvement and support

The lack of parental involvement in the education of children is regarded as one of the most serious challenges faced by teachers. There is a sense that most parents simply dump their kids in schools and do not appreciate the role that they need to play in the education of their children.

Parents need to play a more meaningful role in the education of their kids through collaborative working relationship and effective communication. The Department needs to provide necessary resources and strengthen the effort to eradicate adult illiteracy since this is one of the impediments to the teacher-parent partnership (Huines, 2012)

This is how one principal put it:

"Most parents of our learners do not care about the education of their kids, especially in township and rural schools. When you call meetings they don't come, even if you want to discuss the progress of their children, let alone the problems relating to the running of the school. But when they take kids to former model C schools they attend meetings even late in the evenings;" (R8)

4.3.6. The scope and demands of the job

Mowday et al. (1982), argue that role conflict, role ambiguity and role overload result in high levels of work strain, and that employees who report higher levels of role strain tend to report lower levels of organisational commitment (Paul, 2004).

Most respondents did point out the fact that they felt they were being over-stretched by the demands and the scope of their jobs.

One Head of Department had the following to say:

"As the only HOD in my school I feel that my work is asking too much of me. I end-up having to look at everyone's work. I have to teach... I have to check teachers' files. I
have to moderate all formal assessment tasks, including that of my principal, because every formal task has to be moderated. The principal only moderates my work. I have to keep records, make comments and still do my teaching." (R9)

On post-level I teacher complained bitterly about the fact that she is made to perform functions of a member of the school management team (SMT) while not being paid for that.

This is what she had to say:

"Our school does not have an HOD and I am made to do the duties of an HOD without getting paid, just because I'm senior. Every piece of work that an HOD would do is done by myself. Sometimes I have to leave my work and do something that is supposed to be done by someone else. I even stand in for the principal." (R15)

Another post-level I teacher expressed his frustration:

"Paperwork simply kills me. I don't mind teaching. I can do that for the whole day because I know my stuff. And I enjoy interacting with learners. But there are loads and loads of paperwork, and if your paperwork is not in order, you're like someone who has not done anything." (R12)

4.3.7. Factors affecting job satisfaction
According to Lumley et al (2011), factors that impact on job satisfaction and organisational commitment include, among others, pay, promotion, supervision, operating procedures, coworkers and the nature of the job.

Although not every respondent expressed dissatisfaction with their jobs, there were common factors that were cited as having an adverse effect on job satisfaction. The three main factors were work overload, policy uncertainty and the failure to effect positive change in the system.

(a) Work overload
Work overload was a common theme for most respondents across all teacher-post levels. Most respondents felt that the administrative part of their work took a disproportionate amount of the work time. Such administrative duties include, among others, setting and
administering assessment tasks; drawing lesson plans; marking; recording; processing learner results; drawing subjects and school improvement plans.

This finding is supported by Nagar (2012), who argued that lack of time for managing too many tasks results in teachers developing a contemptuous attitude towards their learners, since they feel that too much is being expected from them in very little time.

This is what a post-level I teacher from a large-enrolment school had to say:

"I wish every school had at least one dedicated admin assistant to help teachers with all the paperwork they have to contend with on a daily basis." (R13)

"...sometimes I mark learners' work for the whole weekend... unpaid overtime!" (R10)

(b) Policy uncertainty

Some respondents felt that it was difficult to say they had mastered their work given what they called "ever-changing" policy direction of the Department.

This is what one HOD had to say:

"Although I'm happy with CAPS (Curriculum and Assessment Policy Statement) because we get to know what to teach and when, one can never be sure what is coming next because the department is always changing... remember curriculum 2005... OBE... NCS..." (R10)

(c) The failure to effect positive change

Some respondents expressed frustration at the fact that the country's education system is generally considered to be performing far below par, and that there is very little that one person can do to change things around.

According to Nagar (2012), when people feel ineffective in their jobs, they develop feelings that their contribution no longer makes a difference. This results in them judging their own work negatively and conclude that they lack skill and capacity to perform.
This is what one principal had to say:

"Every time we attend workshops we are reminded that our education system is not working, and that is frustrating because things are not changing for the better. ...there is nothing that one person can do." (R7)

Other respondents felt let down by their colleagues who were "not doing enough" to improve the quality of education. There was a feeling that if things were to change for the better, everyone had to play a meaningful role and took their work seriously.

This is what one HOD had to say:

"Education is like a chain. There is very little you can do if you receive learners who have not been taught properly in the lower grades." (R10)

4.3.8. Reasons for considering quitting

The reasons given for considering leaving the profession varied from heavy work-load, limited opportunities for promotion and the perceived failure of the system.

This is how different respondents responded:

"I have indeed considered quitting the job, my main reason being heavy work-load. It's very difficult to work in a small school like ours." (R15)

"Opportunities for promotion are limited and there is no recognition for long service and experience." (R11)

"Always being reminded that our education system is one of the worst performing on the continent is hurting. No one wants to be associated with something that is not working." (R12)

4.3.9. Relationship with immediate supervisor

Paul (2004), asserts that the degree of employee commitment to organisational goals and values can be significantly influenced by group leader relations. The same assertion is emphasised in Mhlanga (2012), that employees may have high levels of job satisfaction if their immediate supervisors are understanding, supportive and cooperative, provide
constructive feedback and have good communication skills. A bad relationship between an employee and a supervisor results in dissatisfaction with work.

The importance of the role of a supervisor to any employee was highlighted by the strong views expressed by respondents regarding their supervisors. The respondents' views about their supervisors ranged from heartfelt praises for some and outright disapproval for others. What was striking though was the common understanding that a supervisor plays a critical role in making the life of any employee easy at work.

The following respondents were full of praise for their supervisors:

"Our Circuit manager, who happens to be my supervisor is a hard-working person, very knowledgeable and has empowered us a great deal. If I compare him with our previous manager, I see there is a huge difference. The kind of support that he is giving us has made it easy for me to run the school." (R13)

This is what one post-level 1 teacher had to say about her supervisor (the HOD):

"My HOD is a born leader. She leads by example. We can't complain because she does not just demand that we do the work in a particular way, she shows us her own and is always willing to help." (RS)

Others, however, had nothing good to say about their supervisors:

This is what one HOD had to say about her principal:

"I would be lying if I said I get any help from my supervisor. In fact, I think he is letting everybody down. He is sometimes the reason why we struggle to instil discipline among learners, and some of our colleagues take advantage of the situation." (R10)

One post-level 1 teacher had this to say about her HOD:

"My HOD is just an HOD on paper, but when it comes to doing work, she falls short. She does not add any value to our work. Even her subject content knowledge is
limited. I think it's because she did not major in any of the subjects that she supervises." (R11)

4.3.10. Work demands, skills and experience versus remuneration

According to Robbins et al. (2003), employees want pay systems that are considered to be fair, unambiguous, and consistent with their expectations. When remuneration is perceived to be reasonable, is proportionate to the demands of the job, the employee's skill level, and community pay levels, satisfaction is likely to be the result.

Although most accepted that they have to work hard to earn their leaving, there were serious complaints, especially from those with more experience and higher qualifications, about the salary structure used by their employer. There was a strong feeling that the salary structure does not give fair recognition to experience and higher qualifications.

This is what one HOD had to say:

"I don't have a problem with my work's demands. But it is unfair that the Department does not recognise our qualifications when determining our salaries. You study and get a Masters' degree and all you get is a once-off payment, which is less than half your monthly salary." (R9)

The same sentiments were expressed by a post-level one teacher:

"... Not all of us want promotional posts... I don't care being in post-level. It is unfair that you spend money uplifting yourself and get more knowledge to improve your performance as a teacher and still get nothing in return." (R3)

"The system seems to favour the youngsters. Their entry level qualifications can take them anywhere" said one principal.

The main complaints were not about the salary levels in general but about the perceived injustices in the system.

This is how a principal of a small-enrolment school summed up her frustration:
"As a principal of a small school I have experienced how unfair our pay system is. A principal of a small school is the least paid, yet we are the ones who have to do a lot of work without the support of additional SMT (School Management Team) members as in the case of big schools." (R14)

Another principal echoed the same sentiments:

"Principals of small schools are in a serious disadvantage. We have to teach, attend meetings and do office work...this is not considered when we are paid." (R11)

4.3.11. The prospects of promotion

Draike and Kossen (2002), argue that if employees feel they have restricted career advancement opportunities, their job satisfaction may decrease. The likelihood that employees will be promoted and the fairness of such promotions have an impact on job satisfaction.

There was general consensus that the chances of being promoted in the current education system were very slim compared to other jobs in the public service. The system is designed such that the overwhelming majority of teachers occupy post-level 1 posts.

This is how one post-level 1 teacher put it:

"There can only be a particular number of principals, deputy principals and HODs...the majority will always remain in post-level 1...even long service is not considered." (R11)

This is what another post-level 1 teacher had to say:

"Most teachers work until they retire or leave without being promoted. A police officer, for example, is guaranteed promotion at some stage if they stick in their jobs, but not teachers. Promotion adds to one's love for the job..." (R12)
4.3.12. The processes followed for promotions

According to Adams’ (1965) Equity Theory, it is more likely that when employees regard an organisation to be unsupportive and unfair in their treatment, mainly with regard to the accessibility and regularity of promotional opportunities, their organisational commitment will not be high (Suma and Lesha, 2013).

Most respondents expressed dissatisfaction with the processes followed as well as some practices that have become entrenched in the processes leading to promotions. Complaints ranged from what is seen as the disproportionate influence of teacher unions, the ineptitude of the School Governing Bodies (SGBs) and disregard for qualifications and experience.

This is what one post-level 1 teacher had to say about the influence of teacher unions in the processes of promotion:

"Sometimes it looks like these posts belong to unions. We often hear rumours that a particular union has decided who should be given the post days before the process begins. In most cases those earmarked for position are union leaders in the branches...ordinary members often have nobody to fight for them." (R11)

One HOD had this to add:

"Unions run the show when it comes to promotion posts. They simply lodge a grievance if their person does not get the post, ... it’s their way or no way at all" (R10)

This is what one principal had to say:

"Unions are too powerful, sometimes you get told who to give the post to. Even the... most incompetent person can get promoted if they have the blessing of the union." (R1)

There were also strong views about the perceived incompetence of most members of School Governing Bodies (SGBs). Some respondents felt that the SGBs should be given necessary training to enable them to adjudicate on promotions. Others were of the view that this
function must be taken away from the SGBs, and that Department should be totally in charge of the entire process.

One HOD had this to say:

"I don't understand why we should be interviewed by the SGB members because some of them are uneducated... Sometimes they are just used principals or unions and even Circuit Managers." (R4)

Adding on the perceived incompetence of some SGB members, one respondent shared what she said was her "personal experience":

"A few years ago I applied for a post of Deputy Principal and I was invited to an interview. Different members of the panel (interview panel) took turns to ask me questions. One old lady; an SGB member, failed to read a question correctly... I could figure out what she was trying to ask... while I was undecided whether to proceed and answer, ask for clarity or correct her; the principal, who was overseeing the process, decided to repeat the question correctly... The most unfortunate part is that the same person was also tasked with the responsibility to score all the applicants. This is just one example of what some teachers have to go through in these interviews." (R15)

On the seemingly insignificant role of higher qualifications and experience when promotions are decided, one respondent had this to say:

"Our system will never improve so long as people are not promoted on merit. Qualification is not considered when promoting people... In fact, I think people get intimidated by your high qualification. I don't think it is fair to be supervised by somebody with less experience and lower qualification."

Another respondent had this to say:

"you find that people who have done and passed Education Management are not managing schools."
4.3.13. Work environment:
According to Vasita and Prajapati (2014), Quality of Work Life (QWL) includes type of wages payment, working time, working conditions, health hazards issue, financial and non-financial benefits and management behaviour towards employees.

Most respondents understood their work environment to mean their daily experiences at work as well as the condition prevailing in the community around the school. There was clear understanding that a school cannot be an island of prosperity and comfort in the sea of poverty. The researcher got a clear sense that work environment had a serious impact on the respondents’ attitudes towards their jobs.

One respondent had this to say:

"I spend most of my time at work, and the fact that we still use a pit toilet makes my life at work unbearable."

Theme 4.3.14. Recommendations
Most recommendations put forward by respondents were in line with the sentiments they expressed in response to the interview questions. Recommendations are presented in the next chapter.

4.4. Conclusion
This chapter has focused on the presentation and discussion of the findings of the study. In order to enhance the ease of analysis and presentation, the findings were arranged under different themes and sub-themes that emerged during the interviews. The interviewees’ responses were also grouped according to their (respondents’) post-levels, the sizes as well as the socio-economic backgrounds of their schools. The chapter also outlined the limitations of the study.

The findings of the study pointed to a strong evidence of teacher dissatisfaction with a number of facets of their jobs. Dissatisfaction stemmed from heavy workload, the remuneration structure, processes followed for promotions, the working conditions, poor supervision and limited opportunities for personal development. There was also strong evidence that some of these challenges, especially heavy workload and the lack of
opportunities for development, had a negative impact on their productivity and efficiency. There was also a strong indication that policy issues relating to staffing, the school grading model and the school funding regime needed to be revisited to ensure that they contribute positively to the efficiency of the system. The last chapter deals with the conclusion, the recommendations as well as suggestions for future research.
CHAPTER FIVE
SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

5.1. Introduction
The previous chapter focused on the presentation and discussion of the findings of the study. The findings were arranged under different themes and sub-themes that emerged during the interviews for the ease of analysis and presentation. This chapter focuses on the summary of the study including key findings, the conclusion, the limitations of the study and the recommendations.

5.2. Summary
The challenges afflicting South Africa's education system are well documented. Such problems include, inter alia, high teacher turnover and poor learner achievement in key subjects like Science and Mathematics. In spite of numerous targeted interventions by the Department of Basic Education (DBE) to retain teachers in the system, the department is still faced with an excessively high number of teachers leaving their jobs (Mampane, 2012).

The main aim of the study was to explore the factors that could have an impact on job satisfaction, loyalty and organisational commitment among South African teachers. The study objectives were:

i) To find out how job satisfaction, loyalty and organisational commitment affect the productivity of teachers in Limpopo District.

ii) To understand the factors that lead to the perceived lack of job satisfaction, loyalty and organisational commitment among teachers in Limpopo District.

iii) To establish the roles played by different education stakeholders to improve job satisfaction and organisational commitment among teachers in Limpopo District.

A qualitative research was conducted, where open-ended face-to-face interviews were conducted with school principals, HODs and post level 1 educators.

The results of the study have shown that:
There is evidence of teacher dissatisfaction with certain aspects of their jobs. These include: working conditions, processes of promotions, lack of opportunities for personal development and heavy workload.

The challenges faced by teachers did have an impact on teacher productivity and effectiveness.

There are a number of interventions that different education role-players need to implement in order to make the system work better.

5.3. Limitations of the study
The study relied upon a very small sample of participants, hence its findings cannot be authoritatively generalised on the broader system. Furthermore, the types of schools in South Africa are far more diverse than can be represented by the three types of schools chosen by the researcher. Experiences of teachers in public schools, former Model C schools, firm schools, special schools, private and independent schools are not necessarily the same. The study also did not extend to other important education role-players like the senior management (policy makers) and the school governing bodies.

5.4. Recommendations
5.4.1. Recommendations for further research
South Africa invests heavily on the education system. Of all the government departments, education receives the biggest share of the budget every year, yet this does not translate into tangible results. The researcher is of the view that there needs to be a continuous search for the causes of the system’s underperformance. One area that should be a subject of thorough research going forward is the suitability and effectiveness of the country’s teacher-training curriculum.

5.4.2. Recommendations related to policy
The Department of Education needs to effect policy changes regarding remuneration, promotions, the school funding model, the training of teachers and staffing for schools. The allocation of resources to schools should be based on a model that ensures basic norms and
standards for a viable institution. The role of school governing bodies in the appointment of teachers also needs to be revisited.

5.4.2.1. The allocation of teachers to schools

According to Mowday et al. (1982), role ambiguity and role overload result in high levels of work strain, and employees with such experience report lower levels of organisational commitment.

The Department of Basic Education needs to review the Post Provisioning Norm (PPN) to help alleviate the challenges that rural schools encounter and develop policies to attract and retain qualified teachers (Haines, 2012).

Recommendation 1:
The allocation of teachers to schools should not only be based on learner numbers, which results into a situation where smaller schools are under-staffed. It has to be considered that every school has to offer the full curriculum. The Post-Provisioning Model (PPM) should be primarily based on the curricular needs of the school.

5.4.2.2. The provision of resources

According to Nagar (2012: 55) “lack of sufficient resources or role ambiguity sometimes lead employees towards a feeling of low personal accomplishment.”

Recommendation 2:
The allocation of resources to schools should be based on a model that ensures basic norms and standards for a viable institution. Such a funding model should ensure that every school, irrespective of size, has sufficient resources to promote the efficient delivery of quality education.

5.4.2.3. Remuneration policy

Employees want pay systems that are regarded to be fair, unambiguous, and in line with their expectations. When remuneration is considered to be fair, is comparable to the demands of the job, community pay levels and the employee’s skill level, satisfaction is likely to be the result (Mhlanga, 2012).
Recommendation 3:
The Department should consider implementing a remuneration regime that give full recognition to one's skills, qualifications and experience. The retention of highly qualified and skilled personnel should be high on the Department's agenda.

5.4.3. Recommendations related to practice
5.4.3.1. The work environment
Teachers are the most valuable resource to an educational institution; management must, therefore, devote substantial resources in the continuous assessment and improvement of their working environment, to optimise the quality of service delivery (Nagar, 2012).

Recommendation 1:
The Department should ensure that every school has the necessary facilities and amenities to make the lives of both the teachers and the learners easy. This should include ensuring that the buildings and the premises are in a good condition, with proper sanitation.

5.4.3.2. Capacity building for School Management Teams
The level of employee commitment to organisational values and goals can be considerably swayed by group leader relations. The more flexible and participative management styles can significantly enhance organisational commitment and these styles tend to reduce the levels of stress among employees. If a supervisor provides accurate and more timely types of communication, the work environment is enriched and this is likely to improve employees' organisational commitment (Paul, 2004).

Recommendation 2:
The Department needs to ensure that people serving in the School Management Teams (SMTs) have the necessary capacity empower those that they lead. Capacity building initiatives for SMTs should happen on a continuous basis.

5.4.3.3. Promotions
If employees feel that their career advancement opportunities are restricted, their job satisfaction may decrease. The likelihood that an employee will be promoted as well as the
fairness of the processes of promotion, have an impact on job satisfaction (Drafke & Kossen, 2002, cited in Mhlanga 2012).

Recommendation 3:
The Department should ensure that the processes leading to promotions are free from all forms of manipulation and corruption, and everyone involved in deciding on promotions, including the parent component, should have the prerequisite capacity to do so.

5.4.3.4. Continuous professional development
Recommendation 4:
There needs to be continuous and meaningful professional development for teachers to ensure that they are comfortable with both the subject matter as well as teaching methodology.

This is in line with the assertion by Farooqui and Nagendra (2014), who argued that Human Resource Management should assist in obtaining maximum employee development, ensure meaningful working connection between employers and employees, employees and employers, and necessary moulding of human resources.

5.5. Conclusion

In summary, this research has revealed that teachers have strong views about what they think should change in the system in order to enhance job satisfaction, productivity and organisational commitment among teachers. The study has come to the conclusion that resolving the issues that have a negative impact on the teachers' job satisfaction and organisational commitment would, lead to an improved system of education.

The study has further concluded that there have to be far-reaching changes if South Africa's education system is to improve for the better. Suggested changes range from the school funding model, the post provisioning model, the quintile ranking of schools, the remuneration policy, the processes of promotion, the recognition of higher qualifications and capacity building for School Governing Bodics. The study also recommends that every stakeholder in the education system needs to play a meaningful and conscious role in order to make the system work.

APPENDIX A: INTERVIEW SCHEDULE

Job satisfaction, productivity and organizational commitment among South African teachers

The purpose of this interview is to solicit information from school teachers, Heads of Departments and principals regarding factors influencing their levels of job satisfaction, productivity and organizational commitment in their day-to-day work experiences. The interview should only take approximately 40 minutes to complete. In this interview, you are asked to indicate what is true for you, so there are no "right" or "wrong" answers to any question. Thank you for participating.

1. How long have you been in the teaching profession?
2. What is it that you like the most about your job?
3. What are the challenges that you face in your work regarding the nature of the job, what is expected of you and the availability of resources?
4. How meaningful do you find your work to be in terms of scope and demands?
5. How would you rate your level of satisfaction with your job? Please elaborate.
6. Have you ever considered quitting your job in the recent past? Please elaborate.
7. How would you describe your relationship with your immediate supervisor?
8. What are your thoughts on the demands of your work, your skills, experience and your level of remuneration?
9. How would rate the prospects of being promoted and the fairness of the processes followed for promotions?
10. How would you describe your work environment?
11. Do you have any recommendations on what would enhance your job satisfaction and productivity?
APPENDIX B: ETHICAL CLEARANCE

Education
Department of Education
PROVINCE OF KWAZULU-NATAL

Mr D Simane
PO Box 190
KWAWE
4042
033 243 2041

Dear Mr Simane

PERMISSION TO CONDUCT RESEARCH IN THE KZN DOE INSTITUTIONS

Your application to conduct research entitled "JOB SATISFACTION, PRODUCTIVITY AND ORGANIZATIONAL COMMITMENT AMONG SOUTH AFRICAN TEACHERS", in the KwaZulu-Natal Department of Education institutions has been approved. The conditions of the approval are as follows:

1. The researcher will make all the arrangements concerning the research and interviews.
2. The research must ensure that educator and learner programmes are not interrupted.
3. Interviews are not conducted during the time of writing examinations in schools.
4. Learners, educators, schools and institutions are not identifiable in any way from the results of the research.
5. A copy of this letter is submitted to District Managers, Principals and Heads of Institutions where the intended research and interviews are to be conducted.
6. The period of investigation is limited to the period from 25 September 2016 to 31 October 2016.
7. Your research and interviews will be limited to the schools you have proposed and approved by the Head of Department. Please note that Principals, Educators, Departmental Officials and Learners are under no obligation to participate or assist you in your investigation.
8. Should you wish to extend the period of your survey at the school(s), please contact Miss Conkie Nkabinde at the contact numbers below.
9. Upon completion of the research, a brief summary of the findings, recommendations or a full report / dissertation / thesis must be submitted to the research office of the Department. Please address it to The Office of the HOD, Private Bag X9137, Pietermaritzburg, 3200.
10. Please note that your research and interviews will be limited to schools and institutions in KwaZulu-Natal Department of Education.

UNIVERSITY OF KWAZULU-NATAL JOB SATISFACTION, PRODUCTIVITY AND ORGANIZATIONAL COMMITMENT AMONG SOUTH AFRICAN TEACHERS

By Sibusiso Simamane 9035294

A dissertation submitted in partial fulfilment of the requirements of the degree of Master of Business Administration
Graduate School of Management and Leadership College of Law and Management Studies
Supervisor: Prof. Stephen Migiro 2016

ABSTRACT

This study seeks to interrogate the effects of the perceived lack of job satisfaction, loyalty and organizational commitment on South African teachers and to explore the possible causal factors leading to this phenomenon. To illustrate the extent and seriousness of the problem, the Minister of Basic Education has revealed that some 25 000 teachers left their jobs between 2005 and 2008. She also conceded that South Africa was producing 12 000 less teachers a year than required by the system. The Department of Basic Education has had to resort to recruiting teachers from countries like Zimbabwe and Cuba especially in critical subjects such as Mathematics and Science. This state of affairs points to a system that is in a serious crisis and an urgent need to get to the bottom of the problem. The aim of the study was to explore the factors impacting on the levels of Job Satisfaction, Loyalty and Organisational Commitment among South African teachers. The study objectives were: 1. To find out if the lack of job satisfaction, loyalty and organizational commitment affect the productivity of teachers in South Africa. 2. To interrogate the possible causal factors that contribute to the perceived lack of job satisfaction, loyalty and organizational commitment among South African teachers. 3. To establish
the roles that can be played by different education stakeholders to improve the levels of job satisfaction, loyalty and organizational commitment among South African teachers. Face-to-face open-ended interviews were conducted with a total of 16 teachers comprising of school principals, heads of departments (HODs), and post level 1 educators. Participants were drawn from six secondary schools. Two schools were sampled from the urban, quintile three schools. The second pair of schools was selected from the semi-rural, quintile two schools. The third pair was selected from the rural, quintile one schools. This was to ensure that responses would be a fair reflection of teachers' lived experiences from different economic and social backgrounds. In total six principals, four HODs, and six post level 1 educators participated in the study. The key findings of the study indicate that there were serious challenges facing the education system ranging from heavy work load, especially in low-enrolment schools; a perception of unfairness in processes of promotions; policy uncertainty and a poor work environment. The implication is that there needs to be far-reaching changes in policy pertaining to staffing for schools, promotion processes, in-service training and the role of school governing bodies. The researcher is of the view that there needs to be a continuous search for the causes of the system's underperformance. One area that should be a subject of a thorough research going forward is the suitability and effectiveness of the country's teacher-training curriculum. The difference between quantitative and qualitative...
to explore the possible causal factors leading to this phenomenon. This chapter highlights the
review of relevant literature; the statement of the research problem; the research objectives; the research questions; the delimitation of the study; the assumptions of the study; the definitions of key terms and also outlines the structure of the dissertation. 1.2. Background of the study The problems plaguing South Africa's education system are well documented. Such problems include, among others, high teacher turnover and poor learner attainment in key subjects like Science and Mathematics. According to Mampana (2012), in spite of a number of targeted initiatives by the Department of Basic Education (DBE) to retain teachers in the system, the department was still faced with an unacceptably high number of teachers leaving their jobs. High attrition of experienced personnel has been cited as one of the causal factors to South Africa's failure to meet the millennium development goal of the universal primary education by the year 2014 (Mampana, 2012). A recent study by the Human Sciences Research Council (HSRC) found that some teachers were bunking classes because they themselves struggled with primary school Mathematics (News 24.com, 2013). The factors that point to the apparent lack of organisational commitment, job satisfaction and loyalty among South African teachers include the shocking high level of absenteeism, high employee turnover and regular stoppages and other forms of industrial actions, to mention just a few. It is reported that South Africa has the highest teacher absenteeism rate in Southern Africa. It is reported that on average one teacher is absent for nineteen (19) working days per academic calendar year (News 24.com, 2013). This translates to more than nine percent (9.5%) of learning and teaching time that is lost each year. This picture is even worse when one takes into account the fact that a substantial amount of teaching time is said to be lost while teachers sit idle in staff rooms doing nothing. It is reported that township and rural school teachers use less than fifty (50) percent of class time on teaching, with the majority of that time spent sitting in staff rooms (Ndlovu, 2011: 7). To illustrate the extent and seriousness of the problem, the Minister of Basic Education has revealed that some 25,000 teachers left their jobs between 2005 and 2008. She also conceded that South Africa was producing 12,000 less teachers a year than required by the system (IOL News, 2010). The Department of Basic Education has had to resort to recruiting teachers from countries like Zimbabwe and Cuba, especially in critical subjects such as Mathematics and Science (Mampana, 2012). This state of affairs points to a system that is in a serious crisis and an urgent need to get to the bottom of the problem. South Africa's education system cannot improve and ultimately reach its true potential while these problems persist. It is therefore, important that the root causes of the problems facing our education system are understood. This study should benefit all the major stakeholders involved in education, namely, the policy makers, the School Governing Bodies (SGB's), the school management teams, ordinary teachers, learners, labour unions and the teacher training institutions. Numerous scholars and other opinion makers have done a considerable amount of research on the factors that affect organisational commitment, job satisfaction and loyalty on employees in general. There is overwhelming consensus that a lack organisational commitment, job satisfaction and loyalty impact negatively on employee productivity. Field and Buitendach (2011) argue that there is a strong correlation between organisational commitment and work engagement as well as happiness and work commitment. They then argue that happiness with one's job is a prerequisite for engagement and commitment at work. According to Rampa (2014), passion and motivation play a critical role in the quality of every employee's performance in their jobs. He further emphasizes the importance of an enabling organisational culture and pleasant working conditions in the profession in fostering and sustaining the employee's productivity. Van Dyk and Coetzee (2012) argue that employee-centred HR practices, such as training and development, work-life balance, remuneration and recognition have a positive effect on work commitment of employees. Kooij et al (2013) argue that satisfied employees are time-effective at work and are not likely to take sick leave unless it is extremely necessary. It is therefore, imperative that any factors that militate against employees giving their best at work be identified and addressed. Job satisfaction refers to a positive emotional state resulting from the appraisal of one's job (Katsikea, Theodosiou, Pardisikis & Kehagias, 2011). Bakker and Geerlings (2012) assert that high levels of subjective well-being are associated with high levels of job satisfaction, regular experiences of positive emotions and very rare experiences of negative emotions. According to Patrick and Sonia (2012), employees form attitudes towards their jobs by
taking into consideration their feelings, their beliefs and their behaviours. They further argue that, for this reason, job satisfaction can be defined either as the overall job satisfaction of an employee or the satisfaction with particular aspects of the job, such as pay, working conditions, co-workers, company policies, supervision, the work itself and opportunities for promotion. Organisational commitment is defined as the preparedness of the employees to make a greater and determined effort on behalf of their organisations, a profound desire to stay in their organisations and advance their goals and values. The employees have a sense of duty to the organisation (Rothmann & Viljoen, 2009, cited in Field and Buitendach, 2011). According to Allen and Meyer (1990), cited in Field and Buitendach (2011), Organisational commitment is three dimensional and comprises of affective commitment, normative commitment and continuance commitment. Affective commitment refers to the employee's state of emotional attachment to, involvement and identification with the organization. Normative commitment refers to the employee's feelings of compulsion to remain in the organism. Continuance commitment has two sub-dimensions, namely, personal sacrifice and lack of alternative According to Szympiewska (2014) job satisfaction generally results in a positive attitude towards one's work, co-workers as well as the entire organisation. She further argues that a satisfied workforce builds and actively participates in the success of any organisation. The level of job satisfaction is further influenced by a sense of justice. Worker satisfaction is the outcome of what they receive in exchange for their contributions. Perceived fairness has a positive impact on the levels of motivation and satisfaction (Szympiewska 2014) Neiningler et al., (2010), cited in van Dyk, J, and Coetzee, M (2012) further maintain that organisational commitment results in positive attitudes to jobs and affects outcomes like employees' intentions to leave, organisational citizenship behaviour, performance and job satisfaction. They further argue that, organisational and employee-centred human resource practices like work-life balance, compensation, supervisor support, communication, rewards and recognition, training and development, job characteristics and opportunities to develop careers, influence the commitment of employees. 1.3. The research problem statement South Africa spends the highest percentage of her Gross Domestic Product (GDP) on education. It is clear though, that the huge resources that are pumped into the system do not yield commensurate results. The system is still face with challenges of learner underperformance in critical subjects like Science and Mathematics. The reported high rate of absenteeism among teachers as well as the high teacher turnover, among other challenges, point to a system that is not working optimally. This justifies continuous research into the underlying factors of the challenges in the system. This study seeks to examine the teachers' attitudes to their jobs and explore different interventions that can be made to enhance their job satisfaction and organisational commitment. 1.4. The research objectives The general objective of the study is to explore the factors impacting on the levels of Job Satisfaction, Loyalty and Organisational Commitment among South African teachers. The specific study objectives are: (a) To find out if the lack of job satisfaction, loyalty and organisational commitment affect the productivity of teachers in South Africa. (b) To interrogate the possible contributory factors among South African teachers. (c) To establish the roles that can be played by different education stakeholders to improve the levels of job satisfaction, loyalty and organisational commitment among teachers. 1.5. The research questions To achieve the stated objectives, the study seeks to answer the following question: 1. Does lack of job satisfaction, loyalty and organisational commitment affect the productivity and job performance of teachers in South Africa? 2. What are the contributory factors...
among teachers in South Africa? 3. What contribution can different stakeholders make to improve the levels of job satisfaction, loyalty and organisational commitment among teachers in South Africa? 1.6. The significance of the research

The study is an attempt to get a better understanding of the challenges facing teachers in South Africa and to explore possible solutions. It is hoped that desired job attitudes on the part of teachers will go a long way in improving learner attainment and the standard of education in general. Furthermore, a thorough and continuous research on the topic is made necessary by the dismal performance of South African learners when compared with their peers from other African countries. The Southern and Eastern African Consortium for Monitoring Education Quality (SACMEQ) looked at education inequality, and noted that the poorest 20% of South African learners perform far worse than most of their counterparts in other eastern and southern African countries (Spearle 2012). In the 2011 Progress in International Reading Literacy Study (PIRLS) last, 43% of South African learners failed to attain the low international benchmark. Of the fifteen countries in the region, South Africa’s poorest learners were at 12th place for mathematics, and 14th for reading (Howe et al. 2012). Certainly, the huge investment made by the government in an effort to improve South Africa’s education and the country’s economic status on the continent should be manifest in the standard and quality of education in the country. The fact that this is not happening demands an ongoing probing for answers. 1.7. Delimitation of the study

The research is delimited to the views and lived experiences of school principals, heads of departments, and post level 1 teachers of six secondary schools in the Ilembe District of KwaZulu-Natal department of education. The study was conducted between May 2016 and September 2018.

1.8. Assumptions of the study

The study was premised on the following assumptions: A lot needs to be done to enhance job satisfaction and organisational commitment of South African teachers. Improved job satisfaction and organisational commitment will result in improved productivity and efficiency by teacher thus impacting positively learner performance and attainment. 1.9. Definitions of key terms

1.9.1. Job satisfaction

Job satisfaction has been defined in numerous ways. Lumley et al. (2011, p. 101) defines job satisfaction as "an individual's total feeling about their job and the attitudes they have towards various aspects of their job, as well as an attitude and perception that could consequently influence the degree of fit between the individual and the organisation". According to Suma & Lesha (2013), job satisfaction is an affective response to the job seen either in its totality (global satisfaction) or with regard to specific aspects (facet satisfaction) i.e., pay, supervision etc. Job satisfaction is further understood as the positive orientation of a person towards the role which he/she is presently occupying and the degree to which the employee is comfortable and happy with his/her job (Suma and Lesha, 2013). Job satisfaction is further defined as a gratifying or affirmative emotional state, resulting from the observation of one's job as fulfilling or allowing the fulfilment of one's essential job values (Suma and Lesha, 2013).

1.9.2. Organisational commitment

Organisational commitment has become one of the most common variables studied in the last five decades. Like every other psychological constructs, organisational commitment does not
organizational commitment refers to the willingness of an employee to apply higher levels of hard work for the sake of the organization, approval of its strategic goals, principles, values and beliefs and a strong desire to stay with the organization.

According to Lee et al., (2014) committed employees are generally loyal to their organizations and want to continue their association with their organizations even when there are better options in terms of pay and benefits. The structure of the dissertation: Chapter 1- Introduction In this chapter, the researcher provides a short overview, the motivation of the study, the factors for the research, the research objectives, the research questions, outline of the study and conclusion. Chapter 2- Literature Review The researcher will be gathering information using theoretical aspects and any empirical work done by other scholars like journals, reports, books, newspapers to produce a sound and credible conceptual framework on the topic. Chapter 3- Research Methodology This chapter will deal with the selection of a research design that will suggest the correct method that will be used to collect data as well as the sampling method that will be chosen. The target group of people for the study will also be described in this chapter.

Chapter 4- Presentation and Discussion of the Findings In this chapter, the researcher will present and discuss the findings of the study. The chapter will also examine the ethical issues, trustworthiness, validity, reliability and limitations of the study. The researcher will also outline the limitations of the study. Chapter 5- Conclusion and Recommendations This chapter will deal with the outcome of the study and the recommendations for future studies.
will not extend to demographic information such as age and gender. The research focuses on teachers in general. Each section of the literature review has been examined with the objective of giving the researcher an in-depth knowledge and necessary theoretical background in order to formulate meaningful qualitative interview questions.

2.2. Theoretical and conceptual framework

There are different theoretical approaches to both the concepts of job satisfaction and organisational commitment. This section deals with the three different approaches that have been developed in explaining job satisfaction and measuring the employees' levels of satisfaction. The next part of this section will deal with the three-component conceptualization of organisational commitment. These theories and approaches are very important in trying to understand the reasons for employee behaviour and job attitudes in general. The literature covers relevant research work on job satisfaction and organisational commitment, including relevant concepts and constructs.

2.3. Approaches to Job Satisfaction

The first approach to job satisfaction concerns itself with the characteristics of the job and it is called the "information processing model" (Heckman and Oldham 1976, cited in Vanden Berghe 2011).

According to this approach, employees collect information about the job, the workplace and the organisation and cognitively analyse these features in order to determine the level of satisfaction (Vanden Berghe 2011). The second approach maintained that the measurement of the level of job satisfaction is based on relationships, past behaviour and what occurs at work today. It states the emphasis on the effects of the context and the impact of past behaviour, instead of individual predispositions and cognitive decision-making processes. Therefore, job satisfaction is viewed as how others at work assess the workplace (Vanden Berghe 2011). The third approach maintains that job satisfaction is reliant on the attributes or the dispositions of individual employees. Such dispositions can be determined by experience or genetic heritage or both. In short, job satisfaction can be understood as a function of: (a) the features of a job, (b) the view of others and (c) the individual employee's personality (Vanden Berghe 2011).

2.3.1. Job satisfaction as function of job features

This approach to job satisfaction is divided into two theories; namely, i) the two-factor theory and ii) the job characteristics model. i. Two-Factor Theory Frederick Herzberg (1959), in his Two-Factor Theory deals with the issue of workplace motivation. The theory introduces two factors that account for overall job satisfaction and they are referred to as

- motivators and hygiene factors. Herzberg argues that while the existence of motivators in a job can lead to the improved levels of satisfaction, the presence of hygiene factors in the workplace can
lead to

Motivators are present in the features of the job itself.

(Vanden Berghe 2011). Herzberg's theory explains why employees who earn high salaries and experience great working conditions still lack motivation. According to Herzberg these two elements only represent hygiene factors, which addresses the issue of dissatisfaction. He argues that

motivation comes from the job itself. Therefore, it is essential for managers to look into the nature of the jobs they require their employees to perform.

Herzberg argues that if you want employees to perform well and do a good job, you should have a good job to work with. So in order to improve motivation and job attitudes, employers must pay attention to both factors and not take it for granted

that an increase in satisfaction will mean a consequential decrease in dissatisfaction

(Vanden Berghe 2011).

In their Job Characteristic Model, they identified five critical dimensions for assessing the immediate work environment. They argue that any job can be assessed for its motivating potential by weighting these five dimensions. The

five dimensions, cited in (Vanden Berghe 2011), are skill variety; task identity; task significance; autonomy and feedback. Skill variety describes the extent to which a job entails the application of a number of diverse skills, capabilities or talents. Such activities should not only be different, but must also be distinct enough to necessitate different skills (Vanden Berghe 2011). Skill variety is an apparent diversity and complexity of skills and talents required by a job to perform it. A teacher for example must be good at data analysis and computer literate to be able to effectively analyse learner performance and come up with meaningful interventions. Therefore, employees must possess a range of skills in order to perform their jobs efficiently and effectively. Skill variety in an organization may be attained through continuous training as well as through job rotation (Mhlanga, 2012).
Task Identity: This defines the extent to which a job involves accomplishment of a whole and overall piece of work. Task identity requires an employee to perform all the tasks needed to complete the job from the beginning to the end of the production process.

Task significance refers to the importance of the job; the extent to which the job has an impact on the lives of other people, the organization or the external environment.

According to Sharma & Bhaskar (1991), cited in Mhlanga (2012) the single most important impact on an employee's job satisfaction experience emanates from the type of the work assigned to them by the organization. It occurs that if the job entails - variety, discretion, challenge and latitude for using one's own skills and abilities, the employee assigned the job is likely to experience job satisfaction.

Therefore, employees need to be assigned jobs which they can be identified with, which demonstrates that they are valued assets to the organisation. Feedback refers to the degree to which the employee receives information about the efficiency of their work. This is not only limited to supervisory feedback, but also the ability to observe the effects of one's own work.

(Vanden Berghe 2011). Employees prefer a job that is mentally stimulating, in that it enhances them with opportunities to use their skills and abilities and offers a variety of tasks, freedom and feedback on how well they are doing. The formation of personal goals, feedback on advancement towards these goals, and reinforcement of desired behaviour all contribute to motivation. The fewer, smaller, distortions and misinterpretations that occur in communication within the organization, the more satisfied employees will feel regarding their work (Robbins 1993, cited in Lumley et al. 2011). Feedback may be in the form of compliment for the good work which leads to increased motivation and job satisfaction. It may also come as information for the need to improve on...
certain aspects, which the employee will work on in order to be more effective. When an employee is acknowledged for a task well done it makes them feel important and gives them a sense of self actualisation. This may be the same with feedback which is provided to the employees usually by their superiors (Mhlanga, 2012).

Autonomy is the extent to which the employee is free to schedule the pace of work and select the procedures to be used (Vanden Berghe 2011). According to Buys et al., (2007), cited in Mhlanga (2012) job autonomy is when a jobholder is afforded the power and freedom to exercise his/her own authority while making a decision. Autonomy gives rise to feelings of accountability and responsibility. When an employee is given power to make decisions on their own they are most satisfied as they consider themselves as valuable to the organisation. Heckman and Oldham's model maintains that attention to these five job features produces three important psychological states, i.e. 1. Meaningfulness of work.

For example, teachers may experience meaningfulness of work even in challenging working conditions, because of the belief that their efforts make a difference in the lives of their pupils. 2. Experienced responsibility for outcomes of work: job efforts are observed as causally associated with the end results of the work. 3. Knowledge of the real results of work activities: this can be qualified as feedback. The individual is able to judge the quality of their performance.

(Vanden Berghe 2011). 2.3.2. Job satisfaction as function of other people Salancik and Pfeffer (1978) came up with what they called the social information processing model. According to this model, job satisfaction is subject to the influence of others in the work place. Employees are led to observe and judge the attitudes and behaviours of co-workers with similar backgrounds and interests and of others who are regarded as influential and successful.

(Vanden Berghe 2011). Furthermore, Griffin and Bateman's (1986) study in this field found that there was a strong, positive correlation between behaviour exhibited by leaders and job satisfaction. Salancik and et al (1983) found that perceptions of distributive justice—the fairness of employee outcomes in distributing rewards in the organisation had an impact on job satisfaction.
3.2.3. Job satisfaction as a function of personal dispositions

The notion of personal disposition covers a wide range of facets, which are not necessarily relevant to the subject of job satisfaction. Therefore, for the purposes of this study we will try to deal with the most essential personal dispositions. Affective disposition refers to the tendency to have positive or negative thoughts and emotions, which has a significant impact on one's subjective well-being. Subjective well-being in turn is a key determinant for job satisfaction. It can also be concluded that, besides the nature of the job itself, the affective disposition of an employee is a key determinant for job satisfaction. This means that job satisfaction influences one's overall satisfaction. This means that an employee who is not satisfied with his or her job, but feeling satisfied with his or her life, may perform very well on the job. Also, an employee who is mostly satisfied with his or her job, but largely dissatisfied with his or her life, may perform badly on the job (Vanden Berghe 2011). Gender Lefkowitz (1994), cited in Vanden Berghe (2011), did an analysis of a number of studies and concluded that women's job satisfaction is, on average, lower than that of men. One reason for this phenomenon could be that on average women are less invested in their jobs, since their incomes are, or at least considered to be, merely the addition to the income in the household. Another, more likely, reason why women experience less job satisfaction is that they tend to have less demanding jobs on average compared to men. Following a follow-up study confirmed this conclusion by proving that the differences between women and men in the level of job satisfaction remained when variables such as income, age, education and status were kept equal between women and men (Vanden Berghe, 2011). Magee (2013), argues that the associations among demoralization, quality of work and job satisfaction are far stronger for men than women, which explains the interaction of demoralization with gender. According McKenna, (2000), cited in Vanden Berghe (2011, p. 23), job satisfaction tends to increase during the course of...
working life. Several reasons are advanced for that: older employees have better jobs than younger employees, however, going to a longer career, they had more opportunities to make a desirable job; older people have revised their expectations over the years;

iii. the older generation

... has always been more satisfied; in older people who are more likely to expect early retirement, while the young. Older people are reasoning their jobs. This means to a skewed image of the level of job satisfaction among older employees by cancelling out the dissatisfied cohort. According to Besen et al., (2013), employees of different ages may have diverse needs at work, even when the job is the same, suggesting that for younger employees, providing jobs that give workers the opportunity to use a wide range of skills, to have control over their work and to develop friendships at work, may enhance job satisfaction. While variety, autonomy and friendship tends to be more important to job satisfaction for young adults, older workers, on the other hand, tend to attach more importance on feedback and task significance. The study also concluded that older employees have higher job satisfaction levels overall.

2.4. Dimensions of Organisational Commitment

Allen & Meyer (1990), cited in Mohamed & Anisa (2012), devised a three-component conceptualization of organizational commitment, namely: (a) affective or attitudinal commitment; (b) continuance or behavioural commitment and (c) normative commitment. (a) Affective commitment: Affective commitment refers to the sense of affection and feeling of connection to the organization and is associated with work experiences, organizational structures and individual traits (Meyer et al., 1993), cited in (Mohamed & Anisa, 2012). Affective commitment is a positive affection towards the organisation, which is demonstrated in a desire to see the organisation thrive and a feeling of pride at being associated with the organization (Cohen, 2003, cited in Nagar, 2012). Individuals with strong affective commitment continue working for the organisation eagerly and voluntarily not only because they need the job, but because they want to work (Meyer, Allen and Smith, 1993, cited in Nagar, 2012). In this type of commitment, the employee and the organisation share common values and as a result there is a positive interaction between them (Nagar, 2012). (b) Continuance Commitment

Continuance commitment refers to the minimization of the costs involved in parting with the organisation or job. Employees with high level of continuance commitment stay with the organization as they are subject of the need, make sacrifices, and low probability associated with leaving the organization (Meyer et al., 1993 cited in Mohamed & Anisa, 2012). This has to do with one's experiences and what he/she has given to the organisation. A person with this type of commitment finds it hard to leave his organisation because of the fear of the unknown need it (Nagar, 2012). (c) Normative Commitment

Normative commitment refers to a sense of obligation to continue employment. Employees with high levels of normative commitment consider that they have to
stay in the organization 15 or job as they feel it is right to do so. Normative commitment is the
to which a person is psychologically connected to the organization through internalization of its vision, goals,
objectives, principles, missions and values (Meyer et al., 1993, cited in (Mohamed & Anisa 2012).
Normative commitment can grow

(Meyer et al., 1993, cited in Nagar, 2012). 2.5. Review of relevant literature This part deals with the
body of literature including relevant concepts and constructs by different scholars on job satisfaction and
organisational commitment. The aim is try and understand different factors that are likely to have an
impact the employees' job satisfaction and organisational commitment. 2.5.1. Job satisfaction 2.5.1

Teachers are regarded as the

(Rahman et al., 2013). Understanding of how teachers become committed and satisfied with their work,
and to what extent various factors contribute to their level of commitment, is really critical to enhancing
their performance (Malik et al., 2010). 2.5.1.2. Dimensions of Job Satisfaction Locke (1976, cited in
Mhlanga 2012) presented a number of job dimensions that have been established to contribute
considerably to employees' job satisfaction. Such dimensions represent attributes associated with job
satisfaction. The dimensions include, among others, pay, promotion, supervision and co-workers.
Remuneration (Pay) Remuneration is the payment for work done and can take a number of different
forms, including a basic salary, additional cash payments, such as overtime pay, and benefits in kind
cited in Mhlanga (2012, p. 28), remuneration is defined as “the financial and non-financial extrinsic
rewards offered by an employer for the skills, time and effort provided by the employee in satisfying job requirements for the fulfillment of organisational objectives. According to Luthans (1998), cited in Mhlanga (2012), salaries do not only help people to acquire their basic necessities, but it is also essential in sustaining the higher level needs of people. Compensation includes items such as medical aid schemes, paid leave, pension schemes, bonuses and travel allowances. According to Mhlanga (2012), offering employees reasonable and fair compensation, which is commensurate to the input the employee makes to the organisation, should be the key objective of any compensation regime. This means that for employees to regard their remuneration to be fair and reasonable it must relate to the input they make to the organisation. According to Robbins et al. (2003), cited in Mhlanga (2012), employees want "pay systems that are considered to be fair, unambiguous, and consistent with their expectations. When remuneration is perceived to be reasonable, it is proportional to the demands of the job, the employee's skill level, and community pay levels, satisfaction is likely to be the result."

A study conducted by Voydanoff (1990), in the public sector managers, found that salary levels affect job satisfaction, and that those public sector employees that compared their salaries with those in the private sector had lower levels of job satisfaction. This shows that another way employees gauge if their remuneration is fair is by comparing it to other employees on the same rank. This leads to job dissatisfaction, if employees find that their organisation is paying them poorly in comparison to other organizations' employees. Promotion Heary and Noon (2001), cited in Mhlanga (2012) define promotion as the act of moving an individual up the organisational hierarchy, often leading to an increase in status and responsibility and a better remuneration package. Promotion provides an employee with

- Opportunities for personal growth, added responsibilities and improved social status (Robbins 1993). Job satisfaction is more likely to be experienced by employees who perceive opportunities for promotion to be fair (Robbins 1993; Spector 1997),

- Opportunities for promotion are also likely to have a positive influence on job satisfaction (Landy, 1989; Larwood, 1984,

cited in Mhlanga, 2012). When opportunities for promotion are provided, employees' levels of satisfaction will improve as they know that there is room for individual growth and self-actualization. This may lead to
opportunities for people and advancement in their current jobs, or improve the chance of finding alternative employment. Therefore, if employees feel they have limited career advancement opportunities, their job satisfaction may decrease.

The likelihood that employees will be promoted and the fairness of such promotions have an impact on job satisfaction (Drake & Kossen, 2002, cited in Mhlanga, 2012). Employees seek fair and just promotion practices and policies. Employees who observe that decisions regarding promotions are made in a fair and just manner are more likely to be satisfied with their jobs. Fair and just promotion policies and practices are a foundation for growth in any organisation. When an employee is promoted fairly, based on his true assessment, he/she gets a type of recognition, and hence, it increases his/her job satisfaction (Witt & Nya, 1992, cited in Mhlanga, 2012). A study conducted by Kalleberg & Mastekaasa (2001) cited in Mhlanga (2012) found that promotions improve employees' perceptions of the quality of their job and thereby increase both their commitment and satisfaction. Tolbert (1996), cited in Mhlanga (2012) asserts that opportunities for promotion have different effects

...on job satisfaction because of their differing forms and the effects of accompanying rewards, and the most preferred forms of promotion are by performance and seniority. Promotion through seniority often leads to job satisfaction, but not as much as promotions through performance.

- Co-workers Research has

...pointed out that job satisfaction is subject to the influence of others in the workplace. Employees are inclined to work and complete the best job, and in the company, and the influence of colleagues with comparable jobs and interests, and of superiors who are considered to be successful and powerful (Vanden Berghe, 2011). According to Ghazzawi (2008) cited in Lumley et al., (2011), an employee's co-workers, the groups they associate with, and the culture to which an employee is exposed, all are likely to influence job satisfaction. An employee's level of job satisfaction might be a function of personal attributes and the features of the group to which they belong. The social situation of work is also likely to have a major impact on an employee's attitude and behaviour. Employees' relationships with the supervisor and co-workers has an effect on individual job satisfaction. If a worker does not feel welcome among colleagues it may lead to dissatisfaction with their jobs. Employees get more out of work than just money or tangible accomplishments. For many employees, work also satisfies the need for social interaction. Therefore, having friendly and supportive colleagues improves job satisfaction (Marks, 1984, cited in Mhlanga, 2012). It is however, worth mentioning that although studies have undoubtedly established

...that the influence of others in the workplace on job satisfaction is substantial;

...not everyone is equally susceptible to the influence of others. There are individual differences which can be attributed to differences in personal.
Supervision plays a vital role in job satisfaction in terms of the supervision's support and guidance in work-related tasks (Robbins et al., 2003, cited in Mhlanga, 2012). Managerial ineptitude is devastating to employee job satisfaction and engagement, and contributes significantly to employee burnout. Bad managers cause misery among subordinates and contribute to major losses for organisations. Improved organizational efficiency is attainable by identifying and adapting managerial strengths and dysfunctional dispositions that influence employee job satisfaction and engagement (Leary et al., 2013). Dysfunctional leadership behaviours are not always overt and active (e.g., shouting and direct confrontation), but can also be passive, covert, and indirect (e.g., procrastination, not meeting deadlines and nonspecific directives). Passively destructive leadership can be exemplified by both passive avoidance and passive aggression. Passive avoidance can be characterized by aloofness, insensitivity, and detachment; while passive aggression can be characterized by tardiness, procrastination, and failure to set expectations (Leary et al., 2013). Job satisfaction increases when one's immediate supervisor is friendly, understanding, listens to employees' views, offers compliment for good performance and shows keen personal interest in them. Employees prefer a job that is mentally stimulating in that it offers them with opportunities to use their skills, offers and abilities and offers a multitude of tasks, freedom and feedback on how well they are doing (Robbins, 1993, cited in Lumley et al. 2011). Employees may have high levels of job satisfaction if their immediate supervisors are understanding, supportive and cooperative, provide constructive feedback and have good communication skills. A bad relationship between an employee and a supervisor results in dissatisfaction with work (Mhlanga, 2012). 2.5.1.3 Job Satisfaction and the Quality of Work Life

Quality of work life (QWL), deals with both the intrinsic and extrinsic features of jobs. It is a philosophy, a set of beliefs, which holds that people are the most essential resource in the organization as they are dependable, responsible and essential to making valuable contribution and they should be treated with respect and dignity. QWL includes type of wages payment, working time, working conditions, health hazards issue, financial and non-financial benefits and management policies towards employees. (Vasita & Prajarat, 2014). The
Frustration, boredom and anger common to employees are signs of the quality of work life can be costly to the individual as well as the organisation. Thus, quality of work life stimulates the employee job satisfaction and is vital for enhancing operational and organisational productivity.

Employees who are satisfied a high QWL are more efficient and productive.

Moreover, QWL has a significant effect on human outcomes and noticeably reduces absence, stress, minor accidents and employee turnover. High QWL is also critical for organisations to continuously attract and retain best employees (Vasita & Prajapati 2014). A job is a essential component of life, where a number of factors affect community. Work life is one of the important parts of our everyday life which gives rise to a great deal of pressure if an employee is unhappy with his/her work (Rehman et al., 2013).

2.5.1.4 Job Satisfaction and Person-Organisation fit (POF) The notion of Person-Organisation Fit (POF) deals with the resemblance or congruence between the employee’s own personal values and the values of the organisation, according to the employee’s perception. Person-Organisation Fit has a significant effect on Job satisfaction. Job satisfaction is powerfully motivated by employees’ valuation of the job and assignments they perform, which are the important components of Person-Job fit. Most researchers over the years have concluded that Person-Organisation fit and Person-Job fit should correlate to evaluate job satisfaction since both variables have strong impact on

Job satisfaction and job performance (Farooqui & Nagendra, 2014). While the correlation between job satisfaction and performance is also positive, Person-Organisation fit is a significant antecedent of performance. Job performance of employees is critical in determining an organisation performance. Logic dictates that the better an employee is suited to this job, the less difficult the work he will have to do (Roberts & Robins, 2004) cited in (Farooqui & Nagendra 2014). Farooqui & Nagendra (2014) further argue that
Human Resource Management should assist in obtaining maximum employee development.

Ensure meaningful working connection between employers and employees, employees and employers, and the function of human resources.

Such an understanding should also inform the organisation's policies on selection, recruitment, development, motivation and compensation of human resources. Humans are generally recognized as the most important asset of the organizations. Organizations treat humans as strategic instruments of competence. To get the best performance out of human resource it is vital to give them the assignment that is best suited to their abilities and efforts.

(Farooqui & Nagendra 2014).

2.6. Organisational Commitment 2.6.1. Introduction

A measure of organisational commitment has attained a great deal of attention in the human resource management and psychology literature. As a result, employee recruitment and retention are fundamental attributes in the right performance. Where human relations are strong employees are willing to perform their tasks.

(Brown et al., 2011).

2.6.2. Antecedents of Organisational Commitment There are many factors that are said to have an influence on organisational commitment, but for the purposes of this study, we deal with a few:

- Job characteristics: Job characteristics variables cover broad measures of job scope, challenge, or motivating potential to definite measures like feedback, task identity, autonomy and responsibility (Griffin and Bateman, 1986, cited in Paul, 2004). Hackman and Oldham's (1976) job features model maintains that enriched jobs are highly likely to yield higher levels of organisational commitment (Paul, 2004).

- Procedural fairness: Procedural fairness is an important determinant of organisational commitment as it is perceived by employees as a reward for their efforts (Rehman et al., 2013).

- Group Leader Relations: According to Bruning & Snyder (1983), cited in Paul (2004), if a supervisor provides more timely and accurate types of communication the work environment is enhanced and this is likely to boost employees' organisational commitment. Further, Gaertner and Nollen, (1989) cited in Paul (2004), assert that the degree of employee commitment to organisational goals and values can be significantly influenced by group leader relations. They also argue that the more
participative and flexible management styles can positively and strongly enhance organisational commitment; and that these styles tend to decrease the levels of stress among employees. Promotions, satisfaction, promotions, and organisational identification are the strongest forecasters of organisational commitment. Therefore, providing structured progression, development and job security, and meeting uncertainty avoidance needs of employees become crucial. Therefore, organisations may re-examine their policies related to enhancing commitment by embarking on strategies such as rapid promotions, participative work culture, pension plans, etc., for improving employee organisational commitment (Nagar, 2012). According to Adams' (1965) Equity Theory, cited in Suma and Lesha, (2013), it is more likely that when employees regard an organisation to be unsupportive and unfair in their treatment, mainly with regard to the accessibility and regularity of promotional opportunities, their organisational commitment will not be high. According to Suma & Lesha, (2013), the lack of satisfaction with promotion, and the strong positive relationship between promotion and organisational commitment, means that improving this aspect would lead to an enhancement of organisational commitment. Role Characteristics Mowday et al. (1982), cited in Paul (2004) proposed role characteristics as made up of role conflict, role ambiguity and role overload; and argue that role characteristics result from employees' perceptions of the work environment and have an influence on affective responses; and that employees who report higher levels of role strain tend to report lower levels of organisational commitment. 2.7. Job Satisfaction and Organisational Commitment Most scholars have come to a consensus on the existence of a strong positive relationship between job satisfaction and organisational commitment, as well as between organisational commitment and other desirable work outcomes such as performance and adaptability. Satisfied employees generally tend to be loyal to an organisation, and employees who are committed and satisfied are more likely to stay with an organisation, attend work, arrive at work on time, give good performance and engage in behaviours supportive to the organisation (Aamodt 2007, cited in Lumley et al, 2011). High job satisfaction contributes considerably towards an increase in organisational commitment (Nagar 2012).

Organisational commitment is most probably affected by factors such as type and variety of work, the autonomy involved in the job, the level of responsibility associated with the job, the quality of the social relationship at work, rewards and remuneration, and the opportunities for promotion and career advancement in the company (Riggio 2009, cited in Lumley et al. 2011). The teachers' satisfaction with their jobs may have critical implications for their emotional attachment to the organization. Such attachment or organisational commitment is indispensable
for attracting and retaining suitably qualified personnel as turnover costs to organisations can be very high (Nagar 2012). Organisational commitment is less determined by daily events compared to job satisfaction; it develops consistently and slowly over time, and therefore is understood to be a more complex and enduring construct (Mowday et al., 1979, cited in Suma and Lesha, 2013). Moreover, organisational commitment and job satisfaction do not necessarily happen simultaneously; an employee may display high levels of job satisfaction without feeling a sense of affection to, or obligation to stay in the organisation. Likewise, a highly committed employee may exhibit low levels of job satisfaction (McPhee & Townsend, 1992, cited in Suma and Lesha, 2013).

2.6 Job Satisfaction and Organisational Productivity
It is vital for administrators and managers in organisations to ensure a work environment that promotes higher levels of employee satisfaction. The reason for this is that employee satisfaction has a stimulus consequence on the satisfactions and loyalty of employees, increasing productivity and also improves the quality of outputs (Surujpal & Singh, 2003, cited in Mafini & Pooe, 2013). On the overall, job satisfaction has a positive impact on organisational performance in any public organisation. When employee satisfaction is sustained and elevated, it acts as an incentive to improve organisational performance.

In contrast, organisational performance diminishes when employees are dissatisfied. Satisfied employees are inclined to perceive that the organisation will be more satisfying in the long run, they are concerned about the quality of their work and tend to be more committed to the organisation, resulting in a demonstration of organisational citizenship behaviours.

They also have higher retention rates and are more productive (Mafini & Pooe, 2013). When employees are dissatisfied with their job, emotional and physical health is severely affected (Faragher, Cass & Cooper, 2005, cited in Mafini & Pooe, 2013). As a result, organisational performance will also decline as more production time will be lost since dissatisfied employees tend to take more leave (Judge, Piccolo, Podsakoff, Shaw & Rich, 2010; Shields, 2006, cited in Mafini & Pooe, 2013);

therefore, if appropriate steps are undertaken to improve employee satisfaction, overall success of the organisation is improved and the results can be achieved through happier employees and improved workforce productivity.
2.9. Advantages of Organisational Commitment: A highly committed employee is inclined to identify with the values and goals of the organisation, has a strong willingness to belong to the organisation, is prepared to demonstrate high levels of organisational citizenship behaviour, i.e. a preparedness to go beyond and over their specified and required job duties (Luxmi & Yadav 2011). Work units comprising of employees that, on average, report higher levels of organisational commitment perform better in terms of performance quantity and quality (Conway & Briner 2012). Organisational commitment is generally associated with diminishing abandonment tendencies, which include late-coming and turnover. Furthermore, an employee who is committed to his/her organisation may be more prepared to participate in 'extra-role' activities, being innovative or creative, which can guarantee an organisation's competitiveness (Lumley et al. 2011).

Organizational commitment is vital for attracting and retaining well-qualified employees as only satisfied and committed employees will be keen to continue their relationship with the organization and make significant effort towards attaining its goals (Nagar 2012). Teachers who are highly committed are self-motivated and truthful in whatever they involve themselves in (Nagar 2012).

Furthermore,

employees with high affective commitment show more readiness to perform Organisational Citizenship Behaviour (OCB) as opposed to other employees who are not affectively committed.

Organisational Citizenship Behaviours are highly treasured workplace behaviours exhibited or performed by an employee that is optional, not directly or clearly stipulated by scope of job description, or official remuneration arrangement, and in total promote the efficient and effective running of the organisation. It is the behaviour demonstrated by the employees when their sense of formal rewards for their task is less
behaviours beyond the minimum required levels; altruism means that the employees are always willing to help others working with them; 26. Civic virtue suggests that employees prudently take part in the political life of the organization; sportsmanship suggests that employees do not criticize but have constructive and positive attitudes; and courtesy denotes that the employees value their co-workers and treat them with admiration, respect and esteem.

Conclusion: This chapter dealt with the different theoretical approaches to the concepts of job satisfaction and organizational commitment as well as the review of relevant literature by various scholars pertaining to factors that impact on employees' job satisfaction, productivity and organizational commitment. The aim was to examine the impact of such factors on the teachers' attitudes towards their jobs and the resultant impact on the overall quality of education. The next chapter deals with the research methodology that was employed in the study.

CHAPTER THREE RESEARCH DESIGN AND METHODOLOGY

3.1 Introduction: The previous chapter dealt with the different theoretical approaches to the concepts of job satisfaction and organizational commitment as well as the review of relevant literature regarding factors that impact on employee job satisfaction, productivity and organizational commitment. This chapter deals with methodology and research design employed in this study. It focuses on the paradigmatic positioning of the research study and sampling methods that were chosen to generate data for the study. The chapter finally examines the ethical issues, validity, reliability, trustworthiness and limitations of the study.

3.2 The Aim and Objectives of the Study: The aim of the study was to analyze the impact of the following questions: 1. Does the lack of job satisfaction, loyalty and organizational commitment affect the productivity and job performance of teachers in South Africa? 2. What could be the contributing factors to the perceived lack of job satisfaction, and organizational commitment among teachers in South Africa? 3. What input can different role-players make to improve job satisfaction and organizational commitment among teachers? Based on the above aim, the researcher decided to focus on the study to the following aspects: the nature of the job, supervision, resources, remuneration and opportunities for development and promotion.

3.3 Methodology: This study employed a qualitative research method. The researcher chose the qualitative approach because of its open and involved nature. Qualitative research provides the flexibility to explore and deal
with unknown nuances of the matter being studied. It is not restricted by rigid notions about the topic being interrogated (Flick, et al., 2004). In distinguishing between qualitative and quantitative research, Creswell (2012) asserts that qualitative research is the best approach if a research problem needs quantifiable variables, weighing the effect of these variables on the findings or if the findings need to be applied to a large population. Quantitative research relies on a randomly selected sample to examine a specific variable using statistics and numbers. Data collection is done with controlled instruments. It aims to be objective in testing a specific hypothesis. This eliminates room for any researcher bias. Statistical analysis is used to present results, mean data, correlations and other statistically significant results (Sekaran & Bougie, 2009). Qualitative research, on the other hand, is best suited when a research problem requires that the researcher learns and understands the views of individuals or acquire comprehensive data about a few people or research site (Creswell, 2012). Qualitative research seeks to make sense of important details within a social context, by providing detailed descriptions. Qualitative research allows for the understanding of any phenomenon through the eyes of the respondent (du Plooy-Cilliers, Davie & Bezuidenhout, 2014). Though reliant on a smaller sample, qualitative research is involved and open in its approach. The findings of qualitative research are highly descriptive and succinct. Qualitative research, by its nature, provides the latitude to deal with and explore unknown nuances of the matter being studied. It is not restricted by predetermined concepts about the subject being researched (Flick, et al., 2004, cited in Seedat-Moola, 2014). Qualitative research can capture qualities that trigger subjective experiences, and, the repercussions of these qualities. Therefore, the researcher's objective is to select a method suitable to gathering rich and deep data (du Plooy-Cilliers, et al., 2014). Qualitative research is

...a form of “interpretative inquiry” where the researcher interprets what they “see, hear and understand”, as opposed to quantitative research where the focus is on “surveys and experimental designs”

4 Sampling and Sample Size According to du Plooy-Cilliers, et al., (2014) A sample is a section of a population that is regarded to be representative of a particular population. In quantitative research, a sample is relied upon to generalise particular features of an entire population by examining those specific features in a representative sub-group of that population (Sekaran & Bougie, 2009). Researchers rely on sampling since it is impractical to study an entire population i.e. beside that it is costly and time consuming, analysing an entire population could lead to human error and exhaustion when assembling
and analysing data (Sekaran & Bougie, 2009). Probability and non-probability sampling are the two most frequently used types of sampling. Probability sampling ensures that each unit in the population has an equal chance of being selected for the sample, whereas in nonprobability designs there is no probability of being selected that is attached to the elements of the population (Sekaran & Bougie, 2009). Probability sampling is most preferred where the research requires a sample that is randomly selected, is not determined by the researcher, fits within the common features of the study 30 and leads to results that can be generalised over the total population (du-Ploooy-Cilliers, et al., 2014). Probability sampling is appropriate for a quantitative study and not for a qualitative study (Sekaran & Bougie, 2009). Nonprobability sampling is further divided into two broad categories, namely, convenience sampling and purposive sampling. Convenience sampling entails the collection of data from sample of the population that is readily available to provide it. Purposive sampling, by contrast, targets specific types of individuals who can provide the required information, either for the reason that they are the only ones who have it or that they conform to specific criteria determined by the researcher (Sekaran & Bougie, 2009). This study used purposive sampling approach where six secondary schools were selected in illembe District of the KwaZulu-Natal Department of Education. illembe District services predominantly rural schools with a few urban and semi-urban schools. According to Creswell (2012), in purposive sampling the researcher purposely chooses people and sites to understand the central phenomenon. There were three key units of analysis for this study, namely, school principals, HODs and post-level 1 educators. These were further classified according to the social backgrounds of the respective schools. Two secondary schools were sampled from the urban, quintile three schools. The second pair of schools was selected from the semi-rural, quintile two schools. The third pair was selected from the rural, quintile one schools. This was to ensure that responses would be a fair reflection of teachers' lived experiences from different economic and social backgrounds. In total six principals, four HODs and six post level 1 educators participated in the study. The reason for fewer HODs is that the sampled quintile one schools were low enrolment schools that did not qualify for an HOD. A similar one-on-one interview schedule was used for the principals, the HOD’s and post level 1 educators alike. Respondents were expected to respond based on their lived experiences and their specific job descriptions. Table 3.2: Demographic information of respondents: Respondent’s code Position Gender Teaching experience: School’s quintile ranking & location R 1 Principal Male 17 years Quintile 3, urban R 2 Principal Female 13 Quintile 3, urban R 3 HOD Male 09 Quintile 3, urban R 4 HOD Female 15 Quintile 3, urban R 5 Post level 1 Female 06 Quintile 3, urban R 6 Post level 1 Female 07 Quintile 3, urban R 7 Principal Male 12 Quintile 2, semi-urban R 8 Principal Male 14 Quintile 2, semi-urban R 9 HOD Male 15 Quintile 2, semi-urban R 10 HOD Female 20 Quintile 2, semi-urban R 11 Post level 1 Female 13 Quintile 2, semi-urban R 12 Post level 1 Male 10 Quintile 2, semi-urban R 13 Principal Female 14 Quintile 1, rural R 14 Principal Male 17 Quintile 1, rural R 15 Post level 1 Female 11 Quintile 1, rural R 16 Post level 1 Male 06 Quintile 1, rural Source: Constructed by the researcher 3.5 Data Collection Process: One-on-one Interviews (Appendix A, p 66) were conducted with all participants. Interviews are a two-way conversation in which questions are asked for the purpose of gathering information about the ideas, beliefs, opinions, views and the behaviour of the respondent (Maree, 2012). Interviews allow for flexibility in the data gathering process (Cohen et al., 2011). Open-ended interviews take the form of the discussion between the interviewer and the interviewee (Maree, 2012). This method also allows the researcher to ask the respondents same essential questions in exactly the same order thus improving the comparability of the responses (Cohen et al., 2011). All interviews were conducted face-to-face in order to allow for a free flow of communication between the interviewer and the respondents. This approach is best when dealing with a small number of respondents as it
allows the interviewer to gain perfect perspectives and insights of the respondents, (Creswell, 2009). The interviews were audio-recorded after getting consent of the respondents. 3.6 The Pilot Study Questionnaires can be very tricky to formulate and administer. Defective administration of the questionnaire can lead to uninterpretable data or may result in low respondent returns. A questionnaire should inspire people to cooperate and also produce responses that the researcher can use to construe the results of a study. A questionnaire must therefore, be clear, simple and brief (Leedy and Ormrod, 2010) Piloting questions on a few individuals can help in testing the instrument of research in order to gain clarity. It further helps to eliminate redundant questions and ensure the easy flow of the subsequent interviews (Wilkinson & Birmingham, 2003). The researcher piloted the interview guide with his colleagues who are Senior Education Specialists in Limpopo district of the Kwazulu-Natal Department of Education where he works. The exercise proved to be very helpful and eye-opening, which resulted in some of the questions having to be re-phrased and some eliminated. The researcher ensured that he only solicited information that was essential for the research project. The questions were formulated using terms that the respondents were familiar with. Lengthy and complicated items were avoided as they might have been difficult to comprehend. The researcher tried to pay particular attention to the language and the wording of the questions. The intention was to avoid leading, ambiguous, loaded and double-barreled questions. The interview schedule was thoroughly checked to ascertain that there was a connection between the research questions, the problem statement and the objectives of the study. 3.7 Validity, Reliability and Trustworthiness According to Leedy and Ormrod (2010), validity of any measurement instrument is the degree in which the instrument measures what it was intended to measure. Simply put: validity is about whether or not the researcher measures what they set out to measure in the first instance and the effectiveness of the measurement. Sekaran & Bougie (2009) concur that validity determines if the instrument is truly measuring what it intended to measure, and that reliability and validity concepts are most often used to determine the quality of the study. To this end, the researcher ensured that the aims and objectives of the study were measured against the results of the study. Reliability shows what degree the measurement instrument is precise, free from prejudice, and will consistently yield similar outcomes if used by another researcher (Sekaran & Bougie, 2009). Du-Plooy, et al., (2014) further contend that the concepts of validity and reliability are more suitable for qualitative research where the objective is to determine causal relationships and generalise to a bigger population. Qualitative research seeks to gain a thorough understanding of a phenomenon, consequently the concept of trustworthiness is a better measure of the tool used for this type of study (du-Plooy, et al., 2014). Trustworthiness is divided into the following concepts (du-Plooy, et al., 2014): a) Transferability This refers to the extent to which the conclusions of a particular qualitative study can be applied to other studies and presents a measure of generalisation to a research method that does not emphasise generalizability (du-Plooy, et al., 2014). b) Credibility This is the level of accuracy with which the researcher interpreted the data collected. Credibility is enhanced if the researcher spends a substantial amount of time with respondents to get a better and deeper understanding of their lives. This can include the use of more than one data collection method, which is referred to as triangulation. A good measure of credibility is the extent to which the respondents find the researcher's data analysis to be believable (du-Plooy, et al., 2014). c) Dependability This refers to the level of accuracy with which the data collection method, the analysis of the data and the conclusions are meaningfully integrated (du-Plooy, et al., 2014). In this study thematic data analysis was used to ensure good integration and to enhance meaningfulness. d) Confirmability This is the extent to which the findings of the research are corroborated by the data that was collected (du-Plooy, et al., 2014). In this study each finding is supported by concrete data collected from the respondents. Trustworthiness is absolutely essential to guarantee a meaningful contribution to the body of knowledge (du-Plooy, et al., 2014). 3.8 Data Analysis Qualitative data analysis necessitates the classification of things, persons, and events into specific themes to make data analysis easier (Creswell, 2009).
Ideas are classified according to similarity and therefore, similarity plays a substantial role before an idea is developed.

(Froehlich 2012).

During the data analysis stage, after the interviews had been conducted, they were transcribed precisely as they had been recorded and checked for correctness by the researcher. The transcriptions were studied several times in comparison to the data (Creswell, 2009). The researcher then looked for common themes, topics related to the study, patterns and events to make sense of, and interpret these results. Thematic analysis was then used to interpret data, which involved

3.9 Ethical Considerations The requirement to address ethical issues is of paramount importance in the process of conducting research (Creswell, 2012). According to Rule and John, (2011) ethical considerations are based on three basic principles in research: autonomy, beneficence and non-maleficence. The principle of autonomy entails ensuring that the participants' self-determination is not in any way compromised by the research (Rule & John, 2011). This means ensuring that the participant’s confidentiality, privacy and anonymity is guaranteed. Firstly, the researcher ensured that ethical clearance to conduct research in schools run by the KwaZulu-Natal Department of Education was sought and granted in writing by the Provincial Head of Department before the commencement of the study (Appendix B, p. 67). Informed consent was obtained from all participants. Participants were informed in writing and verbally, that they were free to participate and withdraw from the study at any point if they wanted to without being subjected to any punitive measures. Confidentiality was assured by protecting the identities of participants. Pseudonyms were used in the presentation of data from the participants. The safe keeping and incineration of the audio material after a five-year period further guaranteed participants’ confidentiality. The principle of beneficence entails ensuring that feedback is provided to interested parties (Rule & John, 2011). Participants were informed of the value of the study and its potential in developing insight into
the factors that determine job satisfaction, organizational commitment and, specifically, The

potential value of the study in the formulation of educational policies was also discussed with the participants. In addition, a commitment was made to make the final copy of the study available to the participants on request. The principle of non-maleficence in ethical considerations is about ensuring that no harm is inflicted during all phases of the research process (Rule & John, 2011). The researcher addressed this principle by ensuring that none of the questions or any feature of the study had the potential of causing any harm or injury to any of the participants or any other individual during and after the study. The researcher also ensured that all the interviews were not conducted during teaching time and that they took place at neutral venues away from the schools. This was to avoid interfering with the schools' academic programmes. This was also to ensure that the researcher's position as Subject Advisor in the Department is clearly distinguishable from his role as researcher in this instance, as Wallace and Sheldon (2015), argue that no research is conducted in a vacuum as there are a whole host of power relationship issues when conducting a study in organisations. Such can relate to hierarchical roles and expectations by participants. It must be said though that this made the task even more difficult and tiresome as the researcher had to find times and venues that were convenient to the respondents. 3

17.10 Summary This chapter dealt with the purposes of conducting the study, the methodology as well as the rationale for the methodology relied upon. The study used a qualitative approach as it was the most appropriate for this type of research. Purposive sampling was used to target individual teachers occupying different positions in the system. The sampled individuals also came from schools that differ in terms of socio-economic backgrounds as well as personnel and learner numbers. The semi-structured interviews were conducted, probing participants on their views regarding different aspects of their jobs. The chapter also described how the opinions of 36 established scholars were applied to justify the research methods employed in the study to ensure that the conclusions drawn were theoretically sound, relevant, trustworthy, valid and reliable. The next chapter deals with the presentation and discussion of the findings. CHAPTER FOUR PRESENTATION AND DISCUSSION OF THE FINDINGS 4.1 Introduction The previous chapter dealt with research design and methodology employed in the study, it focussed on the paradigmatic positioning of the research study and sampling methods that were chosen to generate data for the study. The chapter also examined the ethical issues, trustworthiness, validity, reliability and limitations of the study. In this chapter, the researcher presents and discusses the findings of the study. The chapter also outlines the limitations of the study. 4.2 Demographic Information The interviews were conducted with 16 respondents comprising of school principals, heads of department and post-level 1 educators. Male and female respondents were represented in all the three teacher post categories. The respondents were selected using purposive sampling to ensure that, on the whole, they represent schools from different socio-economic backgrounds. Respondents also represented schools of different staff and enrolment sizes. Schools ranged from a small three-teacher school to a large school with twenty-eight teachers. The smallest school only had a principal and two post-level 1 educators, while the biggest had a principal, a deputy principal, four heads of department (HODs) and twenty-two post-level 1 educators. 4.3 Themes and sub-themes of the study The following theme and sub-themes emerged from the interviews conducted (see table 4.1 below): Table 4.1: Themes and sub-themes in the study Theme 1: What one likes about their job Theme 2: Job challenges Sub-theme 2.1 The nature of the job Sub-theme 2.2 Resources Sub-theme 2.3 Parental involvement and support Theme 3: The scope and demands of the job Theme 4: Factors affecting job satisfaction

The failure to effect positive change Theme 5 Reasons for considering quitting Theme 6 Relationship with immediate supervisor Theme 7 Work demands, skills and experience versus remuneration Theme 8 Promotions Sub-theme 8.1 Prospects of promotion Sub-theme 8.2 Processes followed for promotions Theme 9 Work environment Theme 10 Recommendations Source: Constructed by the researcher 4.3.1. What respondents like about their jobs According to Richard Hackman and Greg Oldham (1975) in their Job Characteristics Model, one of the dimensions of job satisfaction is task significance. They argued that although job characteristics play an important role in job satisfaction, the knowledge that one's job makes a meaningful impact in other peoples' lives can have a satisfying effect (Vanden Berghe 2011). This came out clearly in the responses of some participants. Although respondents gave varying reasons why they liked their jobs, what was striking though, is that most reasons had to do with the fact that they derived pleasure from seeing the difference that their efforts made in the lives of their learners rather than the actual nature of their jobs. One respondent had this to say: "There is nothing more fulfilling and heart-warming to me than to see a learner who has been struggling to put together a meaningful sentence progressing and being able to put together a few sentences into a coherent paragraph. Seeing them gradually improving is absolutely gratifying. It also instils confidence in me as the teacher." (R3) Another respondent added: "The knowledge that when I took over as principal six years ago this school had had a string of poor Senior Certificate results, in fact this school was notorious for always being at the bottom of the table of performance; and that we have been able to turn things around to a point where even our enrolment has increased makes me very happy." (R1) One HOD had this to say about the team of teachers that she supervises: "The members of my team always praise me for making their lives easy, instead of demanding work without empowering them, we have always worked together to ensure that everyone understands what needs to be done regarding things like planning, compiling a teacher file, assessment, and even subject content. This has resulted in a very healthy working relationship for our team and has made my work enjoyable." (R4) Of course, there were those who felt that their work gave them more time to spend with families and friends, as one interviewee put it: "My work may be demanding and sometimes boring because I get to repeat one and same thing year-in and year-out but I like the fact that we have enough holidays at regular intervals. In fact, even some of my friends with better paying jobs envy teachers for this." (R8) The nature of their job makes teachers life-long learners themselves, and that is regarded by many as an advantage on its own. They believe that they learn more and remain sharp as they teach others: "My job has made me a better person . . . and more knowledgeable and I learn new things everyday. I find it easy to join a discussion on any topic. Teaching has made me a better public speaker as well." (R15) 4.3.2. Job challenges Respondents came up with a variety of challenges that they face in the execution of their jobs. These ranged from the nature of the job itself, educational policy uncertainty, the work environment, the challenge of the lack of resources and the lack involvement of some important stakeholders in the education system. 4.3.3 The nature of the job Mowday et al. (1982), cited in Paul (2004) proposed role characteristics as made up of role conflict, role ambiguity and role overload; and argue that role characteristics result from employees' perceptions of the work environment and have an influence on affective responses; and that employees who report higher levels of role strain tend to report lower levels of organisational commitment. Most respondent cited work overload as the main challenge facing teachers. A lot of paper work that teachers at all levels have to do over and above the actual teaching was cited as the major challenge facing teachers. Such paper work involves planning, the compilation of work schedules, lesson plans, preparing assessment tasks, marking, recording and processing of learner results. Most teachers felt that such activities take a lot of time that they could otherwise be using for delivering lessons. This is what one respondent had to say: "Paper work is a major problem which takes far more disproportionate time which one would otherwise dedicate to teaching. I teach three sections of the grade six class with a combined total of two hundred and ten learners. Whenever I set an assessment task I can't stop thinking about many hours it would take to mark learner portfolios, record and analyse the results. It's an absolute torture. This means working long hours into the night in most instances. The sheer number of learners also makes it impossible to give every learner necessary individual attention. If truth be told, sometimes it takes me months before I knew every learner by name." (R5) According to teachers from small-enrolment schools their situation is even more dire. The number of teachers allocated to each school is determined, in the main, by the number of learners they have. The Department of Basic Education uses what is called Post-Provisioning 41 Model (PPM) to
determine the number of teacher posts to be allocated to each school. This translates into what is called Post-Provisioning Norm (PPN) for each school. This results in a situation where very small schools end up qualifying for very few teachers, even two or three teachers including the principal. This is what a principal of a five-teacher school has to say about her situation: "My work drives me crazy. I have to perform all my duties as the principal, which includes managing the implementation of the curriculum, worry about the day-to-day running of the school, attend to everyone who visits the school ... I also have to teach three classes ... When I have to attend meetings or workshops my learners are left stranded with no one to teach them ... I also feel for my teachers because I can see they are trying so hard but they are overstretched. Yes, we have few learners but we still have to offer all the subjects, yet there is no manpower. It's really ... really hard." (R13) Some respondents further bemoaned the fact in the case of small schools the current post-provisioning model, not only makes their work difficult, but also seriously prejudices the learners. They argued that it compromises the quality of education that learners receive. This is how one respondent put it: "Because of the shortage of teachers we have had to resort to multi-grade teaching, where you have to teach different grades in the same class at the same time. It becomes so difficult because there is specific content to be taught for different grades even if the subject is the same. Even if you are dealing with the same concept or topic you can’t have similar expectations for both grades ... You have to pitch your presentation at different levels depending on the grade. This arrangement means that learners are short-changed." (R10) 4.3.4. Resources The allocation of funds to schools by the Department of Education (DoE) based on the number of learners a school has, seems to be a challenge for schools small-enrolment schools. Principals of small schools, which are predominantly rural, argue that this fund allocation model by DoE results in their schools’ allocations being so little that they struggle to pay for basic necessities to run the schools. 42 This finding is in line with the assertion made by Nagar (2012), that the shortage or non-availability of material resources for teaching can be a source of stress and burnout for education practitioners. This is what one principal for a small rural school had to say: "I think there is a serious problem with the allocation of funds to small schools. Because allocations are determined per capita based on learner numbers, small schools get so little yet there are standard costs of running any school regardless of its size. We struggle even to pay for basic maintenance, cleaning of premises and even paying for water and electricity." (R14) According to some teachers, especially principals, the categorisation of schools into different quintiles from 1 to 5 has not been without its problems. The criteria used to categorise schools considers, among other things, the type of sanitation a school has, whether it has a library and, most importantly, whether people (parents) in the school’s catchment area can afford to pay. A quintile 1 school is considered to be the poorest and most disadvantaged while a quintile 5 school is considered to be the least poor school. The implication for funding is that the lower the schools’ quintile ranking the more funding it receives and vice versa. One principal expressed her frustration: "... My school is quintile two while our neighbouring school, just across the fence is quintile one, as a result they receive the rural allowance while we don’t ... It can’t be fair. We are still fighting this matter." (R11) The determination of fee-paying and no-fee schools has become a bone of contention in some cases. Some schools have met resistance from parents refusing to pay for their children. This is what a principal of a fee-paying school had to say: "Ours is a fee-paying school, but because our two neighbouring schools are no-fee schools we meet resistance from parents when it comes to the payment of fees. Parents do not even come forward to apply for exemption, because that is provided for based on the parent’s financial situation. Only twenty-one percent of our learners pay. This has led to a situation where we sometimes struggle even to pay for electricity. Sometimes we can’t even buy stationary." (R2) 4.3.5. Parental involvement and support. The lack of parental involvement in the education of children is regarded as one of the most serious challenges faced by teachers. There is a sense that most parents simply dump their kids in schools and do not appreciate the role that they need to play in the education of their children. Parents need to play a more meaningful role in the education of their kids through collaborative working relationship and effective communication. The Department needs to provide necessary resources and strengthen the effort to eradicate adult illiteracy since this is one of the impediments to the teacher-parent partnership (Haines, 2012) This is how one principal put it: "Most parents of our learners do not care about the education of their kids, especially in township and rural schools. When you call meetings they don’t come, even if you want to discuss the progress of their children, let alone the problems relating to the running of the school. But when they take kids to former
I pay, promotion, supervision, poor performance, co-workers and the nature of the job. Although not every respondent expressed dissatisfaction with their jobs, there were common factors that were cited as having an adverse effect on job satisfaction. The three main factors were work overload, policy uncertainty and the failure to effect positive change in the system. (a) Work overload Work overload was a common theme for most respondents across all teacher-post levels. Most respondents felt that the administrative part of their work took a disproportionate amount of the work time. Such administrative duties include, among others; setting and 45 administering assessment tasks, drawing lesson plans, marking, recording, processing learner results, drawing subject and school improvement plans, etc. This finding is supported by Nagar, (2012), who argued that lack of time for managing too many tasks results in teachers developing a contemptuous attitude towards their learners, since they feel that too much is being expected from them in very little time. This is what a post-level 1 teacher from a large-enrolment school had to say: "I wish every school had at least one dedicated admin assistant to help teachers with all the paperwork they have to contend with on a daily basis." (R13) "...sometimes I mark learners' work for the whole weekend...unpaid overtime" (R10) (b) Policy uncertainty Some respondents felt that it was difficult to say they had mastered their work given what they called "ever-changing" policy direction of the Department. This is what one HOD had to say: "Although I'm happy with CAPS (Curriculum and Assessment Policy Statement) because we get to know what to teach and when, one can never be sure what is coming next because the department is always changing..." (R10) (c) The failure to affect positive change Some respondents expressed frustration at the fact that the country's education system is generally considered to be performing far below par, and that there is very little that one person can do to change things around. According to Nagar (2012) when people feel ineffective in their jobs, they develop feelings that their contribution no longer makes a difference. This results in them judging their own work negatively and conclude that they lack skill and capacity to perform. This is what one principal had to say: "Every time we attend workshops we are reminded that our education system is not working, and that is frustrating because things are not changing for the better...there is nothing that one person can do." (R7) Other respondents felt let down by their colleagues who were "not doing enough" to improve the quality of education. There was a feeling that if things were to change for the better everyone had to play a meaningful role and took their work seriously. This is what one HOD had to say: "Education is like a chain, there is very little you can do if you receive learners who have not been taught properly in the lower
grades." (R10) 4.3.8. Reasons for considering quitting The reasons given for considering leaving the profession varied from heavy work-load, limited opportunities for promotion and the perceived failure of the system. This is how different respondents had to say: "I have indeed considered quitting the job, my main reason being heavy work-load. It's very difficult to work in a small school like ours." (R15) "Opportunities for promotion are limited and there is no recognition for long service and experience." (R11) "Always being reminded that our education system is one of the worst performing on the continent is hurting. No one wants to be associated with something that is not working." (R12) 4.3.9. Relationship with immediate supervisor Geertner and Nollan, (1989) cited in Paul (2004), assert that the degree of employee commitment to organisational goals and values can be significantly influenced by group leader relations. The same assertion is emphasised in Mhlanga (2012), that employees may have high levels of job satisfaction if their immediate supervisors are understanding, 47 supportive and cooperative, provide constructive feedback and have good communication skills. A bad relationship between an employee and a supervisor results in dissatisfaction with work. The importance of the role of a supervisor to any employee was highlighted by the strong views expressed by respondents regarding their supervisors. The respondents' views about their supervisors ranged from heartfelt praises for some and outright disapproval for others. What was striking though was the common understanding that a supervisor plays a critical role in making the life of any employee easy at work. The following respondents were full of praises for their supervisors: "Our Circuit manager, who happens to be my supervisor is a hard-working person, very knowledgeable and has empowered us a great deal. If I compare him with our previous manager, I see there is a huge difference. The kind of support that he is giving us has made it easy for me to run the school." (R13) This is what one post-level 1 teacher had to say about her supervisor (the HOD): "My HOD is a born leader, she leads by example. We can't complain because she does not just demand that we do the work in a particular way, she shows us her own and is always willing to help." (R5) Others, however, had nothing good to say about their supervisors. This is what one HOD had to say about her principal: "I would be lying if I said I get any help from my supervisor. In fact, I think he's letting everybody down. He is sometimes the reason why we struggle to instill discipline among learners, and some of our colleagues take advantage of the situation." (R10) One post-level 1 teacher had this to say about her HOD: "My HOD is just an HOD on paper, but when it comes to doing work, she falls short... She does not add any value to our work... even her subject content knowledge is limited... I think it's because she did not major in any of the subjects that she supervises." (R11) 4.3.10. Work demands, skills and experience versus remuneration According to Robbins et al. (2003), cited in Mhlanga (2012), employees want to work in a particular way, she shows us her own and is always willing to help." (R5) Others, however, had nothing good to say about their supervisors. This is what one HOD had to say about her principal: "I would be lying if I said I get any help from my supervisor. In fact, I think he's letting everybody down. He is sometimes the reason why we struggle to instill discipline among learners, and some of our colleagues take advantage of the situation." (R10) One post-level 1 teacher had this to say about her HOD: "My HOD is just an HOD on paper, but when it comes to doing work, she falls short... She does not add any value to our work... even her subject content knowledge is limited... I think it's because she did not major in any of the subjects that she supervises." (R11) 4.3.10. Work demands, skills and experience versus remuneration According to Robbins et al. (2003), cited in Mhlanga (2012), employees want...
qualifications can take them anywhere," said one principal. The main complaints were not about the salary levels in general but the perceived injustices in the system. 49 This is how a principal of a small-enrolment school summed up her frustration: "As a principal of a small school I have experienced how unfair our pay system is. A principal of a small school is the least paid, yet we are the ones who have to do a lot of work without the support of additional SMT (School Management Team) members as in the case of big schools." (R14) Another principal echoed the same sentiments: "Principals of small schools are in a serious disadvantage. We have to teach, attend meetings and do office work...this is not considered when we are paid." (R13) 4.3.11. The prospects of promotion Drafke and Kossen (2002, cited in Mhlanga (2012), argue that if employees feel they have restricted career advancement opportunities, their job satisfaction may decrease. The likelihood that employees will be promoted and the fairness of such promotions have an impact on job satisfaction. There was general consensus that the chances of being promoted in the current education system were very slim compared to other jobs in the public service. The system is designed such that the overwhelming majority of teachers occupy post-level 1 posts. This is how one post-level 1 teacher put it: "There can only be a particular number of principals, deputy principals and HODs... the majority will always remain in post-level 1... even long service is not considered." (R11) This is what another post-level 1 teacher had to say: "Most teachers work until they retire or leave without being promoted. A police officer, for example, is guaranteed promotion at some stage if they stick in their jobs, but not teachers. Promotion adds to ones love for the job..." (R12) 4.3.12. The processes followed for promotions According to Adams' (1965) Equity Theory, cited in Suma and Lesha, (2013), it is more likely that when employees regard an organisation to be unsupportive and unfair in their treatment, mainly with regard to the accessibility and regularity of promotional opportunities, their organisational commitment will not be high. Most respondents expressed dissatisfaction with the processes followed as well as some practices that have become entrenched in the processes leading to promotions. Complaints ranged from what is seen as the disproportionate influence of teacher unions, the ineptitude of the School Governing Bodies (SGBs), disregard for qualifications and experience. This is what one post-level 1 teacher had to say about the influence of teacher unions in the processes of promotion: "Sometimes it looks like these posts belong to unions. We often hear rumours that a particular union has decided who should be given the post days before the process begins. In most cases those earmarked for position are union leaders in the branches... ordinary members often have nobody to fight for them." (R11) One HOD had this to add. "Unions run the show when it comes to promotion posts. They simply lodge a grievance if their person does not get the post, ... it's their way or no way at all." (R10) This is what one principal had to say: "Unions are too powerful, sometimes you get told who to give the post to. Even the... most incompetent person can get promoted if they have the blessing of the union." (R11) There were also strong views about the perceived incompetence of most members of School Governing Bodies (SGBs). Some respondents felt that the SGBs should be given necessary training to enable them to adjudicate on promotions. Others were of the view that this 51 function must be taken away from the SGBs, and that Department should be totally in charge of the entire process. One HOD had this to say: "I don't understand why we should be interviewed by the SGB members because some of them are uneducated.... Sometimes they are just used principals or unions and even Circuit Managers." (R4) Adding on the perceived incompetence of some SGB members, one respondent shared what she said was her "personal experience": "A few years ago I applied for a post of Deputy Principal and I was invited to an interview. Different members of the panel (Interview panel) took turns to ask me questions. One old lady, an SGB member, failed to read a question correctly... I could figure out what she was trying to ask ... while I was undecided whether to proceed and answer, ask for clarification or correct her; the principal, who was overseeing the process, decided to repeat the question correctly... The most unfortunate part is that the same person was also tasked with the responsibility to score all the applicants. This is just one example of what some teachers have to go through in these interviews." (R15) On the seemingly insignificant role of higher qualifications and experience when promotions are decided; one respondent had this to say: "Our system will never improve so long as people are not promoted on merit... Qualification is not considered when promoting people... In fact, I think people get intimidated by your high qualification. I don't think it is fair to be supervised by somebody with less experience and lower qualification." Another respondent had this to say: "... you find that people who have done and passed Education Management are not managing schools." 52 4.3.13. Work environment: According to Vasila
and Prajapati (2014), Quality of Work Life (QWL) includes type of wages payment, working time, working conditions, health hazards issue, financial and non-financial benefits and management behaviour towards employees. Most respondents understood their work environment to mean their daily experiences at work as well as the condition prevailing in the community around the school. There was clear understanding that a school cannot be an island of prosperity and comfort in the sea of poverty. The researcher got a clear sense that work environment had a serious impact on the respondents' attitudes towards their jobs. One respondent had this to say: "I spend most of my time at work, and the fact that we still use a pit toilet makes my life at work unbearable." Theme 4.3.14. Recommendations Most recommendations put forward by respondents were in line with the sentiments they expressed in response to the interview questions. Recommendations are dealt with at length in the next chapter.

CHAPTER FIVE

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS 5.1. Introduction

The previous chapter dealt with the presentation and discussion of the findings of the study. The findings were arranged under different themes and sub-themes that emerged during the interviews. This chapter deals with the summary of the study including key findings, the conclusion, the limitations of the study and the recommendations. 5.2. Summary

The challenges afflicting South Africa's education system are well documented. Such problems include, inter alia, high teacher turnover and poor learner achievement in key subjects like Science and Mathematics. In spite of numerous targeted interventions by the Department of Basic Education (DBE) to retain teachers in the system the department is still faced with an excessively high number of teachers leaving their jobs (MOMPANA, 2012). The main aim of the study was to explore the factors that could have an impact on job satisfaction, loyalty and organisational commitment among South African teachers. The study objectives were: i) To determine if the lack of job satisfaction, loyalty and organisational commitment among South African teachers, ii) To interrogate the possible contributory factors that lead to the lack of job satisfaction, loyalty and organisational commitment among South African teachers, iii) To establish the roles that can be played by different education role-players to improve the levels of job satisfaction, loyalty and organisational commitment among teachers. A qualitative research was conducted, where open-ended face-to-face interviews were conducted with...
school principals, HODs and post level 1 educators. The results of the study have shown that:

- There is evidence of teacher dissatisfaction with certain aspects of their jobs. These include: working conditions, processes of promotions, lack of opportunities for personal development and heavy workload. The research also found that challenges faced by teachers did have an impact on teacher productivity and effectiveness.

- The study has proposed a number of interventions that different education role-players need to implement in order to make the system work better. 5.3. Limitations of the study The study relied upon a very small sample of participants, hence its findings cannot be authoritatively generalised on the broader system. Furthermore, the types of schools in South Africa are far more diverse to be represented by the three types of schools chosen by the researcher. Experiences of teachers in public schools, former Model C schools, farm schools, special schools, private and independent schools are not necessary the same. The study also did not extend to other important education role-players like the senior management (policy makers) and the school governing bodies.

5.4. Recommendations 5.4.1. Recommendations for further research South Africa invests heavily on the education system. Of all the government departments, education receives the biggest share of the budget every year, yet this does not translate into tangible results. The researcher is of the view that there needs to be a continuous search for the causes of the system's underperformance. One area that should be a subject of a thorough research going forward is the suitability and effectiveness of the country's teacher-training curriculum.

5.4.2. Recommendations related to policy The Department of Education needs to effect policy changes regarding remuneration, promotions, the school funding model, the training of teachers and staffing for schools. The 56 allocation of resources to schools should be based on a model that ensures basic norms and standards for a viable institution. The role of School governing bodies in the appointment of teachers also needs to be revisited.

5.4.2.1. The allocation of teachers to schools According to Mowday et al. (1982), cited in Paul (2004) role ambiguity and role overload result in high levels of work strain and employees with such experience report lower levels of organisational commitment. The Department of Basic Education needs to review the Post Provisioning Norm (PPN) to help alleviate the challenges that rural schools encounter and develop policies to attract and retain qualified teachers (Haines, 2012) Recommendation 1: The allocation of teachers should not only be based on learner numbers, which results into a situation where smaller schools are under-staffed. It has to be considered that every school has to offer the full curriculum. The Post-Provisioning Model (PPM) should be primarily based on the curricular needs of the school. 5.4.2.2. The provision of resources According to Nagar (2012: 55) "lack of sufficient resources or role ambiguity sometimes lead employees towards a feeling of low personal accomplishment. Recommendation 2: The allocation of resources to schools should be based on a model that ensures basic norms and standards for a viable institution. Such a funding model should ensure that every school, irrespective of size, has sufficient resources to promote the efficient delivery of quality education.

5.4.2.3. Remuneration policy Employees want pay systems that are expected to be fair, unambiguous, and in line with their expectations. When remuneration is considered to be fair, is comparable to the demands of the job, community pay levels and the employee's skill level, satisfaction is likely to be the result (Robbins et al., 2003, cited in Mhlanga, 2012).

Recommendation 3: The Department should consider implementing a remuneration regime that give full recognition to one's skills, qualification and experience. The retention of highly qualified and skilled personnel should be high on the Department's agenda. 5.4.3. Recommendations related to practice 5.4.3.1. The work environment Teachers are the most valuable resource to an educational institution, management must devote substantial resources in the continuous assessment and improvement of their working environment, to optimise the quality of service delivery (Nagar, 2012) Recommendation 1: The Department should ensure that every school has the necessary facilities and amenities to make the lives of both the teachers and the learners easy. This should include ensuring that the buildings and the premises are in a good condition as well as ensuring proper sanitation.

5.4.3.2. Capacity building for School Management Teams The level of employee commitment to organisational values and goals can be considerably swayed by group leader relations. The more flexible and participative management styles...
can significantly enhance organisational commitment, and these styles tend to reduce the levels of stress among employees. And, if a supervisor provides accurate and more timely types of communication the work environment is enriched and this is likely to improve employees' organisational commitment (Gaertner and Nolen, 1989, cited in Paul, 2004). Recommendation 2: The Department needs to ensure that people serving in the School Management Teams (SMTs) have the necessary capacity to empower those that they lead. Capacity building initiatives for SMTs should happen on a continuous basis 5.4.3.3. Promotions If employees feel that their career advancement opportunities are restricted, their job satisfaction may decrease. The likelihood that an employee will be promoted as well as the even-handedness of the processes of promotion have an impact on job satisfaction (Drafke & Kossen 2002, cited in Mhlengi 2012). Recommendation 3: The Department should rid the processes leading to promotions of all forms of manipulation and corruption; and everyone involved in deciding on promotions, including the parent component, should have the prerequisite capacity to do so. 5.4.3.4. Continuous professional development Recommendation 4: There needs to be continuous and meaningful professional development for teachers to ensure that they are comforable with both the subject matter as well as teaching methodology. This is in line with the assertion by Farooqui and Nagendra (2014) who argued that

5.5. Conclusion In summary, this research has revealed that teachers have strong views about what they think should change in the system in order to enhance job satisfaction, productivity and organisational commitment among teachers. The study has come to the conclusion that resolving the issues that have a negative impact on the teachers' job satisfaction and organisational commitment will lead to an improved system of education. The study has concluded that there has to be far-reaching changes if South Africa's education system was to improve for the better. Suggested changes range from the school funding model, the post-provisioning model, the quintile ranking of schools, the remuneration policy, the processes of promotion, the recognition of higher qualifications and capacity building for School Governing Bodies. The study has also recommended that every stakeholder in the education system needs to play a meaningful and conscious role in order to make the system work.
