**PLAGIARISM DECLARATION**

I Adefolarin Fawole declare that:

- (i) The research reported in this dissertation, except where otherwise indicated is my original work.
- (ii) This dissertation has not been submitted for any degree or examination at any other university.
- (iii) This dissertation does not contain other persons’ data, pictures, graphs, or other information unless specifically acknowledged as being sourced from other persons.
- (iv) This dissertation does not contain other people’s writing unless specifically acknowledged as being sourced from other researchers. Where other written sources have been quoted, then:
  - a) Their words have been re-written but the general information attributed to them has been referenced;
  - b) Where their exact words have been used, their writing has been placed inside quotation marks and referenced.
- (v) Where I have reproduced a publication of which I am an author, co-author, or editor, I have indicated in detail which part of the publication was actually written by myself alone and have fully referenced such publications.
- (vi) This dissertation does not contain text, graphics or tables copied and pasted from the Internet, unless specifically acknowledged, and the source is detailed in the dissertation and the References sections.

## DECLARATION

This Master of Medical Science dissertation is my work and all primary and secondary sources have been appropriately acknowledged. The dissertation has not been submitted to any other institution as part of an academic qualification.

This dissertation is prepared in partial fulfilment of the requirement of the Master of Medical Science (Occupational and Environmental Health) at the School of Family and Public Health Medicine, Nelson R Mandela School of Medicine, University of KwaZulu-Natal, Durban South Africa.

Discipline of Occupational and Environmental Health,  
School of Nursing and Public Health  
University of KwaZulu-Natal South Africa

15 July 2022

This is the student's unaided original work except where a specific indication is given to the contrary. The work has not been submitted previously to this or any other University.

## ACKNOWLEDGEMENT

162

163

164

165 All glory and gratitude to God Almighty for giving me the enablement and making this possible.

166 This is only by His grace.

167

168 Professor Rajen Naidoo, my supervisor, for painstakingly taking me through this journey.

169 I am grateful, Prof

170 My darling wife, Adebola Abosedo, and my fantastic children – Oyinkansola and Olayiwola.

171 You are my anchors in life's troubles indeed. Thank you.

172

173 My brother, Olufemi Fawole for his selfless help throughout the writing of this dissertation.

174 Thank you, "Froggie"

175

## ABSTRACT

239 **Background:** Prisons and penitentiaries are viewed as environments that act as reservoirs for the  
240 transmission of infectious diseases within their confines. This is due to the 'closed' system they  
241 operate. The prevalence of these infectious diseases like pulmonary tuberculosis (PTB) among  
242 prisoners or inmates has been reported repeatedly in various settings.

243 **Aim:** To determine the workplace factors that might lead to an increase in the risk of PTB  
244 disease among Correctional Facility Workers (CFWs) in prisons in KwaZulu-Natal (KZN)

245 **Method:** An assessment of the prevalence of PTB disease among the CFWs at three correctional  
246 services facilities located within the province was conducted. These were randomly selected from  
247 a total of 37 prisons in KZN. Questionnaires were administered to determine work activities that  
248 may place CFWs at increased risk for acquiring PTB.

249 **Results:** There was a response rate of 74.2%, (n=224 participants). Employees had a mean age of  
250 39.2 (SD: 9.2) years and the mean for the number of years worked in the Correctional Facilities  
251 was 9.9 years (SD: 6.03). Among the sample, 21.8% had PTB disease during their employment.  
252 Nearly a quarter of the CFWs (33 (14.7%)) who had previously been in contact with PTB-  
253 positive offenders were diagnosed with PTB while working at the Correctional Facilities. Medical  
254 and allied health workers presented with substantially increased (albeit imprecise) risk for  
255 acquiring PTB during employment (OR: 19.8 (95% CI: (1.9-202) and OR: 29.4 (95% CI: (2.65-  
256 326) respectively)

257 **Conclusions:** Findings indicate that CFWs are at risk of developing work-related PTB disease.  
258 Healthcare workers recorded a higher prevalence than any other job description. This suggests  
259 increased exposure among healthcare workers in these correctional facilities. Appropriate  
260 interventions are necessary for the protection of these workers.

261

262

263

264

## CHAPTER 1

### 265 **Introduction**

266 South Africa is on the World Health Organization's (WHO) list among 30 nations with a  
267 significantly high burden of disease as it relates to tuberculosis and it has a very high incidence  
268 rate of notified tuberculosis among the countries in the world<sup>1</sup>. Furthermore, it has been reported  
269 that tuberculosis remains widespread in South Africa, with an approximate prevalence of over  
270 800 cases per 100,000 population <sup>1</sup>. TB could affect any organ in the body, mostly the lungs.  
271 Hence, it is essentially divided into pulmonary and extra-pulmonary TB. Of concern in this study  
272 is pulmonary TB (PTB). There is also the phenomenon of TB Infection and TB Disease. The  
273 infection entails the acquisition of the infective organism, but the host does not fall ill at that time.  
274 This is also called 'latent' TB Infection because the organism may remain hidden in an individual  
275 without being infectious or ill. TB disease on the other hand, even though acquired similarly will  
276 present with symptoms and is infectious.

277

278 As previously stated, there is a preponderance of communicable diseases in the confines of most  
279 prisons, and the environment enables the favourable spread of these diseases first among inmates,  
280 and then among correctional facility workers (CFWs). These members of staff end up  
281 propagating the disease upon further interaction with colleagues, family members, and society at  
282 large.<sup>2</sup>

283

284 In societies where optimal health care is unattainable like in prisons, they tend to be favourable  
285 environments for the growth and propagation of infectious diseases - this is enhanced by the  
286 presence of suitable human hosts. Places that are densely populated, for instance, prisons, are  
287 important reservoirs for TB transmission. These ultimately pose a threat to those in the general  
288 population.<sup>3</sup>

289

290 According to the WHO, TB thrives in prisons, and it has become a common saying that prisons  
291 concentrate, disseminate; make worse; and export TB.<sup>3</sup> People that are at risk of becoming  
292 infected and subsequently transmitting TB within prisons are the prisoners or inmates themselves  
293 and CFWs. These would include the warders, cooks, and clinic staff, especially because of their  
294 interactions with the prisoners or inmates. These categories of staff could further transmit the  
295 disease to their families and the community<sup>3</sup>

296

297 PTB disease is an important social problem largely affecting disadvantaged and marginalized  
298 communities worldwide. However, according to plans to stop the spread of TB globally,(2011–  
299 2015) there is advocacy for early identification and treatment of all TB cases. Furthermore, the  
300 need to intensify screening for people in confinement and other populations at risk is  
301 encouraged<sup>4</sup>. Due to an increased risk of sickness, high prevalence of mental instability with the  
302 attendant risk of self-harm, and elevated rates of infectious diseases especially TB and Human  
303 Immunodeficiency Virus (HIV), inmates are regarded as a particularly vulnerable population.<sup>4</sup>  
304 The WHO Global TB Control Review also found that the incidence of TB, TB/HIV co-infections  
305 and HIV is higher in penitentiaries than in the community. <sup>5</sup>

### 306 **Background**

307 Numerous factors have been identified as risk factors in the general workplace setting that  
308 ultimately determine the incidence and transmission of PTB disease, with the most prominent risk  
309 factor being HIV infection. Extremes of age, previous TB infection, sex and smoking are also  
310 identified as risk factors. In the prisons, however, the focus on the infrastructure of the prisons  
311 puts more emphasis on security rather than environmental controls to reduce the spread of  
312 infection. A 2015 study of TB determinants in a Bloemfontein prison concluded that a leading  
313 factor that might result in TB outbreaks in prisons is the architectural design and the living  
314 conditions of the prisons. Thus, the consequence of poor ventilation enhances a high transmission  
315 of PTB disease and outbreaks will affect the inmates, the CFWs as well as the attending  
316 healthcare workers and eventually the general population.<sup>5</sup>

317

318 Environmental risk factors for infection and possible disease outbreaks will include:

- 319 1. Inadequate ventilation.
- 320 2. Overcrowding.
- 321 3. Close contact among prisoners, CFWs, and visitors.
- 322 4. Suboptimal health services, e.g. delay in diagnosis and treatment initiation and hence  
323 failure to interrupt transmission.

324 It is of public health concern that TB is transmitted continuously from the prisoners to people  
325 they are in close proximity with. One of the main challenges we face in sub-Saharan Africa (SSA)  
326 is the poor information we have regarding TB and other infectious diseases in prisons. Unlike the  
327 numerous reports and literature on TB emanating from the USA and Europe, there is little  
328 information available regarding PTB disease in Southern African prisons. Largely, this is caused  
329 by poor or non-existent surveillance, data collection, and reporting. For the data available in SSA,  
330 up to 5% of TB is seen among inmates. There is a suggestion that TB prevalence (lifetime

331 prevalence) in prisons of certain African countries like Zambia, Malawi, and the Ivory Coast is  
332 many times higher than the general public.<sup>3</sup> A report by Global Fund stated that the prevalence of  
333 TB within prisons could be 50 times more than the rates observed among the general population.<sup>4</sup>

334

335 South Africa accounts for up to 3% of TB disease cases worldwide. Considering the population,  
336 the country is frequently seen as one of the highest when it comes to global TB incidence.<sup>6</sup> South  
337 Africa is therefore regarded as a high-TB disease burden country. Studies have shown that the  
338 TB prevalence in prisons could be as much as 80 times more than the general population, with an  
339 8-fold greater incidence of TB in middle/low-income countries (M/LIC) compared with high-  
340 income countries (HIC).<sup>2</sup>

341

342 In 1992, a study examined the incidence of TB infection in a New York prison, focusing on  
343 prison employees. It was reported to be the first prospective investigation of TB among CFWs.  
344 Cohorts considered included CFW, social workers, teachers, and medical personnel. Those  
345 categories who had the least contact with prisoners – clerks, management, and maintenance staff -  
346 were the referent group. A follow-up study was done a year later. It was discovered that  
347 approximately one-third of the employees had new TB infections, as diagnosed by tuberculin skin  
348 testing (TST) and repeat testing a year later (two-step testing), even though it was recorded that  
349 there was 0.16% evidence of PTB disease among inmates.<sup>7</sup>

350

351 The 2021 Global TB report estimates that South Africa is among 8 countries which account for  
352 two-thirds of the global total. Despite organized efforts and plans to optimize tuberculosis control  
353 programmes with a significantly large quota of international funding over the last 20 years, the  
354 disease remains a socioeconomic issue with the disadvantaged communities of the world mostly  
355 bearing the brunt<sup>8</sup>

356

357 A Tuberculin skin test (TST) survey was conducted among CFWs in Malaysia, looking at Latent  
358 TB Infection (LTBI). There was a high prevalence of TST positive among the CFWs – up to  
359 81%.<sup>9</sup> This high prevalence was attributed to the degree of occupational risk the CFWs were  
360 exposed to. Incidentally, in the same state in Malaysia, the positive TST prevalence was  
361 remarkably higher among CFWs than was seen among HCWs, highlighting the fact that prisons  
362 are more potent reservoirs of TB than healthcare facilities.

363

364 Literature is limited globally regarding the magnitude of the problem of TB disease within the  
365 confines of correctional facilities, among the inmates and staff. Questions remain about the  
366 effects of TB disease as an occupational hazard among CFWs in South Africa.

367

368 **Literature Review**

369 The study involved a literature search in the PubMed, Google Scholar and Web of Science  
370 databases using MeSH Terms and phrases as follows: “Correctional services”, “prisons”,  
371 “tuberculosis”, “inmates”, “occupational Tuberculosis”, and “worker”

372

373 This literature review covers PTB disease among workers likely to be at risk for occupational  
374 PTB, in particular CFWs. There is overwhelming evidence that describes TB among Healthcare  
375 Workers (HCWs). Occupational TB in other congregate settings is not well described in the  
376 literature. PTB among offenders has been extensively reported. There, however, have been  
377 limited reports among CFWs, particularly in South Africa. Inmates can easily transmit PTB  
378 disease not only to co-inmates but to the staff of the correctional facilities as well, especially, with  
379 unreported cases of PTB among inmates on transfer from other correctional facilities which have  
380 high incidence rates of TB. Overcrowding in the correctional services, malnutrition, and poor  
381 ventilation, which are commonplace in correctional facilities can also aid in the transmission  
382 mode and rate among all residents of the facility. This review focused on social and occupational  
383 factors, and how they contribute to PTB disease among CFW.

384

385 Note on terminology: While conducting the literature review, the terms ‘inmates’, and ‘prisoners’  
386 were widely used. Hence, these are featured as part of the search strategy. However, in South  
387 Africa, the appropriate terminology is “offenders”. This term is used throughout the dissertation,  
388 irrespective of the term used in the study that is being cited.

389

390 *Tuberculosis among Inmates in Correctional Facilities*

391 It has been widely documented that inmates in penal facilities transmit PTB disease, which  
392 provides a problem for TB control.<sup>10</sup> The setting and frequent overcrowding in prisons and jails  
393 make transmission easier<sup>11</sup> According to estimations, TB prevalence is between 5 and 50 times  
394 greater in penal institutions than the average indices seen in the population.<sup>5</sup> Olivia Cords et al.  
395 conducted a thorough review and meta-analysis of the literature spanning 40 years (1980-2020).<sup>12</sup>  
396 Based on the WHO classification, the study examined the various geographic regions of the  
397 globe. In addition to discovering that TB infection and disease were significantly greater in  
398 prisons than in the general population, researchers also discovered that inmates had a higher  
399 chance of becoming infected with the disease. Except for North America and the Western Pacific,  
400 all seven of the world's regions had prevalence of at least 1000 per 100,000 people. At a 95%  
401 confidence interval, the combined incidence of TB infection among prisoners was 15.0 per 100

402 person-years.<sup>12</sup> Due to the close contact between inmates, infectious diseases can be easily spread  
403 within jails. Both TB and HIV/AIDS are major infectious disease morbidity and mortality causes  
404 worldwide, and jails have frequently turned into reservoirs for these illnesses.

405

406 Globally, the prevalence of tuberculosis (TB) among convicts might be up to 50 times greater  
407 than national statistics. TB disease in jail is a significant concern throughout the rest of the world,  
408 particularly SSA<sup>13</sup> Aside from immunosuppression brought on by HIV, prisoner-associated risk  
409 factors such as inadequate nutrition, stress, drug and alcohol abuse, malnutrition, and related  
410 chronic illnesses are frequently linked to the high prevalence of TB in prisons. In addition,  
411 unsanitary living conditions in prisons with inadequate ventilation encourage the spread of  
412 *Mycobacterium tuberculosis* among inmates. These host and environmental risk factors make it  
413 easier for new *M. tuberculosis* infections to develop into active diseases, a risk that is at least a  
414 factor of ten times higher in prisons than it is in the general population.<sup>13</sup>

415

416 In the analysis of articles on HIV and tuberculosis in sub-Saharan African prisons from 2011 to  
417 2015, Telisinghe L et al were able to locate information on only 24 of the 49 nations in the  
418 region.<sup>14</sup> In cases when data was available, it was typically of poor quality and infrequently  
419 nationally representative. HIV infection prevalence ranged from 2% to 34%, and tuberculosis  
420 prevalence ranged from 0 to 16 %; prisoners almost always had a greater incidence of both  
421 diseases than the general population in the same nation.

422

423 In a Johannesburg prison, the prevalence of undetected tuberculosis with positive cultures was  
424 high at 3.5%. However, if those with conventional chest radiographs or sparse sputum smears but  
425 negative cultures were included, the prevalence would increase to 7.5%.<sup>15</sup>

426 Because of different sampling strategies, screening methodologies, and case definitions, direct  
427 comparison with other prison surveys from SSA, which reported tuberculosis prevalence ranging  
428 from 1 to 6% (3% at a prison in KwaZulu-Natal), was challenging. Our study's tuberculosis  
429 prevalence was greater than the projected rates for South Africa's general population (0.8% in  
430 2010) and from mines (about 2.2%).<sup>15</sup>

431

432 Although the consensus is that early diagnosis and treatment of PTB disease is germane, this is  
433 not extended to prisons it is often neglected and thus put workers at risk.<sup>16</sup> Among offenders in  
434 correctional facilities, much work has been done in assessing the prevalence of PTB. <sup>17</sup> High  
435 prevalences of active and latent TB cases were reported (2.5% and 61.8% respectively) among

436 detainees in a prison in Bahia, Brazil.<sup>15</sup> Furthermore, it was observed that the figures found for  
437 the prevalence of active TB, if projected for the population (2,500 cases/100,000 population) and  
438 compared with the overall prevalence reported in Bahia in the same period (approximately  
439 60/100,000 population), was 42 times greater than what was discovered among the general public  
440 in the state of Bahia. This is buttressed by the findings of a systemic review and meta-analysis  
441 done in 2021 where prevalence of about 1,000 per 100,000 population was recorded<sup>12</sup> The  
442 conclusions of the study corroborate the results observed by several other authors regarding the  
443 estimated prevalence of active TB in prison facilities being higher than that found in the  
444 community<sup>18,19</sup>

445

446 Accurate data on PTB disease in prisons in SSA countries are not readily available since  
447 surveillance and data reporting mechanisms are poor or non-existent.<sup>6</sup> In the Mangaung  
448 correctional facility study of 2015, the prevalence of PTB disease was 8.8% (8772 per 100 000)  
449 among inmates. The authors report that this prevalence was nine times greater (948 per100 000)  
450 than the total TB prevalence of the general population (unspecified) as reported in 2009.

451

452 TB infection in correctional facilities is a phenomenon that threatens inmates and CFWs  
453 (regardless of their job allocation and description) who happen to be at increased risk of being  
454 infected with TB due to the environment they work in and the prevailing conditions. During  
455 interactions with their families and the community, these members of staff may transmit the  
456 disease further. Because of the restrictive nature of the prison infrastructures, the attendant poor  
457 ventilation, the sub-optimal health services, and other issues, there is the emergence and spread of  
458 Pulmonary TB disease which is drug-resistant and is ultimately being transmitted to the general  
459 population.<sup>16</sup>

460

#### 461 *Tuberculosis among Staff in Correctional Services*

462 From the available literature, it seems LTBI has been the subject of more investigations than  
463 active TB among CFWs. In a cross-sectional study on TB among prison workers,(health care and  
464 security staff) in Rio Grande do Sul, Brazil, even though no cases of active TB were identified  
465 among the CFWs, the prevalence of latent TB was 27.9%.<sup>20</sup> A Malaysia survey found an  
466 astonishingly high (81%) prevalence of TST positivity among CFWs, which was linked to longer  
467 jail employment. It emphasised the potential occupational risk in such a congested environment

468 without a regular TB screening program.<sup>9</sup> Grenzel et al demonstrated that there is a substantial  
469 risk of TB transmission outside of prisons<sup>21</sup>.

470 Regardless of the job description - administrative, security, or healthcare services, LTBI is a  
471 common occurrence among CFW. Although it is challenging to demonstrate that transmission  
472 took place within correctional facilities, their study concludes that their data lends support to this  
473 viewpoint. In Sub-Saharan Africa, HIV infection also contributes to a higher risk of both inmates  
474 and staff in correctional services being infected with TB - up to 70% of adults with TB are co-  
475 infected with HIV.<sup>16</sup> Even though there are insufficient studies exploring risk factors within  
476 prisons, based on reports from other working environments and general community-based studies,  
477 there are several factors found in prison settings, and similar congregate settings that are likely to  
478 contribute to these <sup>22</sup>

#### 479 *TB, Occupational hazard for HCWs*

480 As mentioned previously, TB infection and disease have been extensively studied among HCWs.  
481 Because of the lack of literature on CFWs, the healthcare workplace, as a congregate setting to  
482 which workers are exposed to TB-infected “clients” provides an opportunity to understand the  
483 risk among the lesser studied CFWs. The systemic review study conducted in the USA, Brazil,  
484 and other places by Baussano et al.<sup>23</sup>, provides evidence that the total risk for TB is higher among  
485 HCWs when compared with the risk in the community. This finding was replicated among HCWs  
486 in India, who had a three-fold greater risk for disease when compared to the general population.<sup>24</sup>  
487 Similarly, HCW in KwaZulu-Natal, South Africa had a higher incidence of TB depicting a  
488 greater risk of contracting TB infection when compared with the larger community<sup>25</sup>

489  
490 A systematic review of TB among HCWs in low- and middle-income countries reported a  
491 prevalence of 54% on LTBI, in 2006.<sup>26</sup> In this study, certain workplaces (centres with inpatient  
492 TB facilities, laboratories, internal medicine, and emergency facilities) and professions  
493 (radiologists technicians, patient attendants, nurses, ward attendants, paramedics, and clinical  
494 officers) were linked to a higher risk of contracting TB disease. DNA fingerprint surveillance was  
495 used to determine that of the 67 HCWs studied over 5 years in the Netherlands, 42% contracted  
496 TB disease from work.<sup>27</sup>

497  
498 Although the elevated risks among HCWs seem self-evident, the occupational risk factors  
499 indicate this risk being extended to other congregate workplaces, such as correctional facilities.

500 The occupational risk factors, such as poor ventilation, small “work” spaces (wards in health  
501 facilities), close contact with clients, and non-diagnosis of clients on presentation to the facility,  
502 are factors that extend into correctional facilities.

503 While studying TB among HCWs specifically in KZN, researchers concluded that the TB  
504 epidemic in South Africa has been fuelled by the HIV pandemic, historical disregard for health  
505 care, fragmented health systems, increased migration, and weak political commitment to TB  
506 control.<sup>28</sup>

507

## 508 **Problem Statement**

### 509 Overview

510 The global estimate of prisons in a country is said to account for the origin of a quarter of all TB  
511 cases reported in the entire country.<sup>5</sup> The disease is not restricted to the prisoners alone, but also  
512 the CFW who eventually interact directly with their families and the community at large when not  
513 at work thereby propagating TB.<sup>2</sup>

514

515 Pulmonary tuberculosis disease transmission requires close proximity in which the infected  
516 person shares a breathing zone with a susceptible individual. Transmission is also enhanced in  
517 buildings with poorly designed ventilation plans which is seen in prisons because the design  
518 focuses more on security than infection control.<sup>5</sup> It will, therefore, seem inevitable that the  
519 affected prisoners would transmit the illness to correctional services officers and staff with whom  
520 they are often in close proximity. This situation makes CFWs quite vulnerable to PTB disease,  
521 and it can be classified as an occupational health hazard. This is certainly a public health concern  
522 as these CFWs eventually go out into the community, possibly continuously propagating the  
523 disease.

524

525 Unfortunately, there is a paucity of data when it comes to prisons worldwide in actual terms of  
526 the prevalence or incidence among CFWs.<sup>5</sup> While there have been many comprehensive reports  
527 of TB in prisons in the USA and Europe, there has been a paucity of literature on TB in African  
528 prisons, and accurate data on TB in prisons in SSA countries are not readily available since  
529 surveillance and data reporting mechanisms are poor or non-existent.<sup>4</sup> This poses a challenge as  
530 the knowledge of the extent of this problem among CFWs is limited in South African prisons.

531

532 Prevalence in this thesis is the number of TB cases among correctional facility workers within the  
533 facilities under study among currently employed correctional facility workers within the last 10  
534 years, as reported in the questionnaires

### 535 **Research Questions:**

536 This study, therefore, sought answers to these research questions:

- 537 1. What is the prevalence of pulmonary TB disease among correctional services staff in  
538 KZN prisons?
- 539 2. What are the risk factors that can predispose the staff of correctional services in KZN  
540 prisons to developing pulmonary TB disease?
- 541 3. What are the occupational factors that enhance TB transmission from prisoners to the  
542 staff of correctional services in KZN prisons?

### 543 **Hypothesis:**

544 CFWs are at greater risk compared with the general population of acquiring pulmonary  
545 tuberculosis because of their increased workplace risk.

### 546 **Objectives and Aims**

547 Overall Objective

548 To determine the prevalence of pulmonary tuberculosis disease and workplace factors that  
549 increase the risk of PTB among correctional facility workers in prisons in KwaZulu-Natal (KZN)

550 Specific Aims

- 551 1. To describe the prevalence of pulmonary tuberculosis (PTB) disease among the different  
552 categories of correctional facility workers at prisons in KwaZulu-Natal
- 553 2. To describe workplace factors that contribute to PTB disease in prison environments.
- 554 3. To describe individual and social risk factors that contribute to PTB disease among the  
555 staff.
- 556 4. To determine workplace factors associated with PTB in multivariate modelling, adjusting  
557 for individual factors and social risk factors

605

606 **ABSTRACT**

607 *Background:* The high prevalence of pulmonary tuberculosis (PTB) disease among offenders in  
608 correctional facilities has been reported repeatedly in various settings. Against this background,  
609 workplace factors are likely to increase the risk for PTB disease among correctional facility  
610 workers. This study aims to describe the prevalence and determine work-related risk factors  
611 associated with PTB disease among correctional facility workers in KwaZulu-Natal province,  
612 South Africa.

613 *Methods:* A descriptive cross-sectional study was conducted at three major prisons in the province  
614 of KwaZulu-Natal, selected based on size and population. PTB outcome was assessed by the  
615 information available from the questionnaires and obtained from risk assessment tools.  
616 Standardized questionnaire responses from participants included work history, workplace  
617 exposures, use of protective equipment, and lifestyle factors. Jobs were categorized as medical  
618 staff, allied staff, administrative staff, correctional workers, and ancillary staff. Logistic  
619 regression, adjusting for age, educational background, HIV status, smoking, and socioeconomic  
620 status, was used to determine the risk for PTB.

621 *Results:* There was a response rate of 74.2%, (n=224 participants). Employees had a mean age of  
622 39.2 (SD: 9.2) years and had worked in correctional facilities for a mean of 9.9 years (SD: 6.03).  
623 Among the sample, 21.8% had PTB during their employment. 33 of the CFWs (14.7%) who had  
624 previously been in contact with PTB-positive offenders were diagnosed with PTB while working  
625 at the correctional facilities. Medical staff and allied health workers presented with an increased  
626 risk for acquiring PTB disease during employment compared with administrative staff, ancillary  
627 staff and correctional workers (OR: 19.8 (95% CI: (1.9-202) and OR: 29.4 (95% CI: (2.65-326)  
628 respectively).

629 *Conclusion:* Our findings provide evidence that CFWs are at risk for developing work-related  
630 PTB. Healthcare workers recorded a higher prevalence than any other job description. This  
631 suggests increased chances of disease among healthcare workers in these correctional facilities.  
632 Appropriate interventions are necessary for the protection of these workers.

633 *Keywords:* Prisons, Correctional Facility Workers, workplace risk, Pulmonary Tuberculosis

634

635

636 **Introduction**

637

638 South Africa has one of the highest burdens of PTB disease, with a prevalence of 852/100 000  
639 population attributed to South Africa.<sup>1</sup> Similarly, incidence of 615/100,000 per population in 2019  
640 and overall TB prevalence of 737/100,000 per population in 2017 were reported<sup>2</sup>. Globally, 1.5  
641 million people succumb to TB every year<sup>3</sup>. The risk of TB in detention centres is especially  
642 concerning in South Africa, a country with the highest incidence rates of TB and HIV/AIDS.<sup>4</sup> The  
643 incidence of TB in low/medium income countries (LMIC) prisons is 8-fold more than that  
644 reported in countries with high income (HIC).<sup>5</sup> The Global Fund estimates up to 10 million people  
645 are imprisoned in various penitentiaries globally.

646

647 Statistically, South Africa is recorded as having the continent's largest prison population  
648 (147,922).<sup>4</sup> The Global Plan to Stop TB programme (2011 to 2015) advocates the need to  
649 intensify screening for the most at-risk populations, including people in confinement.<sup>6</sup> Prisoners  
650 are regarded as a particularly vulnerable population. The WHO Global TB Control Review also  
651 found an elevated prevalence and incidence of TB, HIV, and TB/HIV co-infections among  
652 offenders. TB prevalence among inmates and prisoners globally by estimation could be about 50-  
653 fold greater than the national average. Thus, CFWs are likely to be at high risk, as they are often  
654 in close proximity to the offenders.

655

656 Literature is scant about the prevalence and incidence of PTB among CFWs. Some studies have  
657 been carried out in Brazil and Malaysia<sup>7,8</sup> In Malaysia, an extraordinarily high (81%) prevalence  
658 of latent Tuberculosis infection (LTBI) among full-time personnel of Malaysia's largest prison  
659 was reported, and this was correlated with longer employment duration and current tobacco  
660 smoking. In the Brazilian study, even though no active TB cases were documented, LTBI  
661 prevalence was 27.9%, again attributable to the quantity of time the CFWs had been working in  
662 prisons.

663

664 Apart from these limited reports on exposure and risk in correctional facilities, workers in other  
665 congregate settings, are likely to present with similar risk profiles. These workplaces include  
666 homeless shelters, old-age homes, schools, places of worship, and group homes. In some studies  
667 on congregate settings in China, the prevalence of active PTB cases was 11.8%<sup>9</sup>. This confirmed  
668 that the prevalence of active TB disease was especially high among known risk categories, such  
669 as contacts and crowded areas.

670 Despite South Africa's PTB epidemic, the documentation of the disease is poor in most  
671 workplace settings, apart from healthcare and the mining sectors. Reports are virtually non-  
672 existent for CFWs. This study aimed to determine the workplace factors that increase the risk of  
673 PTB disease among CFWs in prisons in KwaZulu-Natal province, South Africa.

## 674 **Methods**

### 675 Study Sites

676 A descriptive cross-sectional study was conducted at three major prisons (Fort Napier in  
677 Pietermaritzburg Medium B, Westville in Durban, and Glencoe in Dundee) in the KwaZulu-Natal  
678 province.

679

### 680 Study Population and Sample

681 The three correctional facilities were chosen in the province based on the size of the facility, the  
682 number of offenders present and the number of CFWs employed. These are Fort Napier, in the  
683 town of Pietermaritzburg which is a Medium facility (Pietermaritzburg Medium A), Westville in  
684 Durban (which is Medium B, referred to as Durban Maximum) and Glencoe, a Medium facility in  
685 Dundee. The numbers of CFWs employed in each institution were 585, 615, and 235  
686 respectively.

687

688 Previous studies among CFWs,<sup>10,11</sup> in Malawi and the United States reported the prevalence of  
689 occupational TB as 4.48% and 0.6% respectively. The closest available population-based  
690 prevalence of tuberculosis was recorded in Malawi in 1997 and it reported a prevalence of  
691 81/100,000, which we used as the "non-exposed" population<sup>12</sup>. Based on this data, we determined  
692 that a sample size of 360 was necessary to show an association between work and PTB disease  
693 with a power of 80% and  $\alpha=0.05$ .

694

695 The recruitment procedure first included obtaining a record list of all workers from each facility,  
696 and systematic sampling of every fifth person on the list was conducted. We conducted this  
697 process at each of the centres in Pietermaritzburg Medium B, Medium B, Durban Maximum, and  
698 Glencoe respectively until the sample size was achieved. These members of staff were invited to  
699 participate in the study.

700

701

702

703 Data Collection

704 After the completion of the selection process, the invited participants were assembled in a hall in  
705 each facility, based on the duty schedules of each CFW. The whole exercise covered 3 weeks. In  
706 returning the questionnaires, the participants were advised on the specific procedure to ensure  
707 confidentiality and mitigate their own possible concerns. The participants completed the  
708 questionnaires at their convenience, placed them in anonymized envelopes that were provided to  
709 them, sealed these envelopes personally, and then submitted them to the senior staff. All  
710 envelopes were sealed prior to handing the questionnaires to their supervisors. There was no  
711 method of identification either on the envelope or in the submission process. These sealed  
712 envelopes were then collected by the researcher. The researcher verified that all returned  
713 envelopes had no unbroken seals on collection.

714

715 At the end of the exercise, 224 (74.2%) copies of the questionnaire were returned by the  
716 participants while 78 (25.8%), with either ‘no response’ or ‘partial responses’ were collected.  
717 The questionnaire was provided in English and isiZulu thus giving the participants opportunities  
718 to read and respond in their language of choice. It consisted of questions addressing workplace  
719 and individual factors that might contribute to infection transmission. The questions included job  
720 title, previous TB diagnosis, use of Respiratory Protective Equipment (RPEs,) ventilation system  
721 being used at a workstation, etc.

722 Risk assessment tools were developed to obtain additional data in addition to the questionnaires.  
723 These were based on a tool used to assess PTB exposure risk in health facilities in eThekweni,  
724 KwaZulu-Natal<sup>13</sup> and were subsequently administered to only the heads of the various  
725 establishments in face-to-face interviews. The goals of these tools were to identify the risk  
726 exposure of CFW in their working environment.

727

728

729 Statistical Analysis

730 Data was captured using Microsoft Excel. This was double captured, compared and corrected to  
731 ensure accuracy while analysis and presentation of the data were done using the STATA Version  
732 15.0 (StataCorp. Texas 77845 USA).

733

734 The key dependent variable was a diagnosis of PTB disease while working at a correctional  
735 services facility, as reported by the participant. Independent risk factor variables included non-  
736 occupational risk factors for PTB, including HIV status, history of smoking, and overcrowding at

737 home. Workplace factors included exposure to offenders with PTB disease or offenders with  
738 symptoms compatible with PTB, length of employment at the prison, and job title. The other  
739 covariates considered in the study were age, educational background, and socioeconomic status.  
740 At the bivariate level, cross-tabulations were used among variables of interest, chi-square  
741 analyses were used for categorical variables, and t-tests for continuous variables. The hypothesis  
742 was tested using logistic regression in STATA. Those covariates that, in the bivariate analyses  
743 were significant at p-value <0.2 were included in the models, along with the exposure variables  
744 (job titles, years worked, RPE used when in contact with suspected TB cases, and TB contact  
745 during employment)

746

747 Ethics

748 All participants signed informed consent forms and they were informed of the option of refusing  
749 to take part with no consequences or opting out of participation at any point without any  
750 questions asked. Ethical approval was sought and obtained from the Biomedical Research Ethics  
751 Committee of the University of KwaZulu-Natal (Reference number: BE 336/18). Institutional  
752 permission was obtained from the Department of Correctional Services

753

754 **Results**

755 The heads of the various institutions assisted with filling out the risk assessment tool during the  
756 face-to-face interviews. These provided additional information regarding policies, the physical  
757 infrastructures of the prisons as it relates to ventilation and behavioural differences amongst the  
758 CFWs. It highlighted the administrative and engineering controls as well as the respiratory  
759 protective equipment that were available. Table 1 presents findings from the risk assessment tool.

771

772

773

774 The risk assessment interviews indicated that the management of risks across the institutions  
775 appeared to be identical, due to the striking similarities in the infrastructures of these facilities.  
776 Screening of staff was said to be done routinely in all 3 centres, in various stages. These are the  
777 pre-employment (performed just before the commencement of work in DCS), the periodic (done  
778 at specified time intervals while under employment) and the exit screening, which is a  
779 prerequisite before leaving the employment of DCS. In addition to the screening, all centres  
780 attested to the fact that they have existing TB infection control policies which were being adhered  
781 to, even though only one centre has regular training. As part of the evidence of compliance with  
782 the policy, floors and surfaces were swept and mopped at least once a day. Bed linens were  
783 changed fortnightly in the two centres. Sick bays and consulting rooms were designated places for  
784 sputum collection.

785

786 All centres relied on natural ventilation through open windows and burglar-proofed doors.  
787 Depending on the specific areas considered in the centre, the other methods include local exhaust  
788 ventilation and industrial fans. CFWs were said to have been provided with RPE by way of N95  
789 masks in only one centre. There was no fit testing nor was there any formal training on the  
790 wearing and the use of these masks before distribution. None of the CFWs were said to be  
791 compliant with the wearing of these masks.

792

793 The majority of the study participants were females, accounting for 54.9% as seen in Table 2  
794 below. The average age of the sample was 39 years (SD: 9.2). The average years of employment  
795 in the correctional facility institutions were 9.9 with no meaningful differences among those with  
796 and without PTB. Among the sample, 21.8% were diagnosed with TB while employed at the  
797 correctional facility. More females (61.2%) than males had been diagnosed with PTB. The study  
798 also revealed that 65.3% of the staff diagnosed with PTB disease had a household occupancy of  
799 more than three members. There were no remarkable differences statistically between those with  
800 and without TB for key health disorders. Overall, there was a prevalence of HIV (28.6%) and  
801 asthma (22.4%).

802

803

804 **Table 2: Participant demographics (N=224)**

<b>Demographic variables</b>	<b>TB Diagnosed at DCS n=49 (22%)</b>	<b>No TB during employment n=175 (78%)</b>
<b>Facility</b>		
Glencoe (n=47)	12 (25.5)	35 (74.5)
Pietermaritzburg Medium B (n= 69)	14 (20.3)	55 (79.7)
Medium B, Durban Maximum (n= 108)	23 (21.3)	85 (78.7)
<b>Sex</b>		
Male (n= 101)	19 (18.8 )	82 (81.2)
Female (n=123)	30 (24.4 )	93 (75.6 )
<b>Age (mean) (SD)</b>	38.7 (10.13)	39.3 (9.01)
<b>Number of household occupants</b>		
Less than or equal to 3	17(18.3)	76 (81.7)
More than 3	32 (24.4 )	99 (75.6 )
<b>Transport mode</b>		
Personal vehicle	43 (23.2 )	142 (76.8 )
Public transportation	6 (15.4 )	33 (85.0 )
<b>Level of formal education</b>		
Up to high school	20 (25 )	60 (75 )
Undergraduate/postgraduate	29 (20.1 )	115 (79.9 )
<b>HIV positive status</b>	14 (20.3 )	55 (79.7 )
<b>Asthma</b>	11 (33.3 )	22 (66.7 )
<b>Persistent coughing</b>	12 (80 )	3 (20 )

805 Among all those diagnosed with PTB during employment, 67.3% were ancillary (support) staff as  
806 shown in Table 3. Of the total health and allied staff participating in the study (n=25), almost half,  
807 approximately 44% had acquired PTB disease during employment, compared to approximately  
808 19% in all other job categories combined. Contact with offenders that had tested positive for PTB  
809 was a risk factor present among 67.3% of those diagnosed with PTB while under the employment  
810 of the correctional facility. Only 38.9% had always complied with wearing their N95 face masks  
811 during contact sessions with inmates with PTB disease at the facility (Table 3).

812

813

814 **Table 3: Risk Factors by PTB diagnosis. Sample size (n=224)**

<b>Risk Factors</b>	<b>PTB Diagnosed at DCS n=49 (22%)</b>	<b>No PTB during employment n=175 (78%)</b>
<b>Job Description</b>		
Medical staff	6 (42.9)	8 (57.1)
Allied (Health) Staff	5 (45.5)	6 (55.5)
Administrative Staff	1 (3.7)	26 (96.3)
Correctional Official (Warders)	4 (13.8)	25 (86.2)
Ancillary Staff	33 (23.1)	110 (76.9)
<b>RPE used when in contact</b>	19 (21.8)	68 (78.2)
<b>TB contact during employment</b>	33 (19.4)	137 (80.6)
<b>Years worked at DCS facility (mean (SD))</b>	9.9 (6.3)	9.9 (5.9)

815

816 Allied staff –Health care professionals other than doctors; Ancillary staff – Support staff

817 RPE – Respiratory Protective Equipment used when in contact with suspected TB cases

818

819 Logistic regression (as shown in Table 4) revealed that despite broad confidence intervals, the  
820 medical (OR=19.8, 95% CI: 1.9, 202) and allied staff (OR=29.4, 95%CI:2.65, 326) had a  
821 substantially elevated risk of acquiring PTB disease while in the employ of the DCS, adjusting for  
822 years worked at the facility, PTB contact, use of PPE, smoking and HIV status. Of note was the  
823 fact that ancillary staff, although not having direct contact with inmates also showed a statistically  
824 significant elevated risk (OR=8.7, 95% CI: 1.01, 70.5). The participants’ history of cigarette  
825 smoking (OR=3.2, 95% CI: 1.1, 9.3) was an important risk factor. Other workplace risk factors  
826 that did not show statistically significant risk were contact with a TB inmate, years of working,  
827 and lack of the use of respiratory protection.

828

829

830

831 **Table 4. The crude and adjusted odds ratio for variables in the table (n=224)**

Risk Factors	TB Diagnosed at DCS	
	Unadjusted OR (95% CI)	Adjusted OR (95% CI)
<b>TB contact (n=17)</b>	1.74 (0.87-3.51)	1.9 (0.89-4.1)
<b>Years working at the facility (mean = 9.9)</b>	0.94 (0.5-1.80)	1.6 (0.58-2.30)
<b>Ever smoked (n=55)</b>	3.21 (1.20-8.67)	3.2 (1.1-9.3)*

835 **and HIV status**

836

### 837 **Discussion**

838 In this study, the first report of PTB disease among CFWs in South Africa, the job title of  
839 participants was an important risk factor for acquiring an infection during employment. Medical  
840 and allied health staff were at a higher risk of developing TB than administrative staff. Results  
841 from this study suggest that other CFWs such as the ancillary staff who were not in close contact  
842 with the offenders were also at risk although not as high as those of the medical and allied health  
843 staff.

844

845 A total of 49 (22%) CFWs reported being diagnosed with PTB disease since the commencement  
846 of their employment in the correctional facility where they worked. This prevalence is high when  
847 compared to other reports among CFWs in countries like Malawi and the USA.<sup>10,11</sup> Studies in  
848 prisons in the United States have found a point prevalence of 17.7%<sup>14</sup>. A Canadian study also  
849 reported a point prevalence of 32% among about 100 correctional workers<sup>15</sup>. This prevalence  
850 compares with a lower rate among inmates in South African Correctional facilities of 8.8%<sup>16</sup>.

851 In a recent national prevalence study of TB in South Africa, using a multistage, cluster-based,  
852 cross-sectional survey design, among 35 191 participants, older than 15 years, a prevalence of  
853 852 per 100,000 was reported. Similarly, an incidence of 615/100,000 population in 2019 and  
854 overall TB prevalence of 737/100,000 population in 2017 were reported.<sup>2,17</sup> Against these  
855 statistics, we report a strikingly higher prevalence among CFWs .

856

857 Pleural TB (which is an extra pulmonary form of TB) is a close differential to PTB. This is often  
858 a source of diagnostic dilemma for health care workers. In some instances, patients presenting  
859 with clinical features suggestive of PTB or pleural TB are not comprehensively investigated along  
860 the line of Pleural TB if PTB is highly suspected<sup>18</sup>. Also, even though pleural TB is expected to  
861 resolve spontaneously by default, anti-TB treatment is advisable because around 80% of patients

862 have associated lung lesions. A significant portion of these individuals can develop active  
863 pulmonary TB either immediately or in the future<sup>19</sup>. Hence, both categories of patients are treated  
864 with the same regimen of anti-TB drugs

865

866

867 The rate of occurrence of PTB disease is high among CFWs, regardless of where they work in the  
868 facilities based on their job descriptions. Occupational factors particularly among those who have  
869 been in employment for 11 years or more are significantly associated with TB transmission.  
870 Communicable diseases are common in congregate settings such as prisons and correctional  
871 facilities, as well as detention centres, homeless shelters, and group homes. Time spent with  
872 patients, job designation, work location, and failure to wear personal protective equipment were  
873 among the risk factors identified to be responsible for HCWs acquiring TB. Studies in Kenya,  
874 Malaysia, and India examined risk factors for TB among HCWs and identified only 2 common  
875 risk factors: time spent with patients (particularly TB patients) and work location<sup>20,21,22</sup> They  
876 found that HCWs (clinical staff) who spent more time per day with tuberculosis patients had a 2-  
877 fold odds of developing tuberculosis when compared with HCWs who spent less than 8 hours  
878 with TB patients. This study did not specifically explore the length of time spent in certain  
879 common areas as an important risk factor for TB transmission, even though some other studies  
880 did report such.<sup>23</sup>They found that there was the possibility that the occupational risk of TB  
881 transmission in correctional institutions may be less directly related to job type than to  
882 environmental factors such as ventilation or infection control practices.

883 Thus, the increased risk may be due to closer or more frequent contact with patients. Galgalo and  
884 colleagues found an increased risk for tuberculosis among HCWs who spend  $\geq 5$  hours per day  
885 with patients in Kenya<sup>20</sup> Additionally, a case-control study from India identified 2-fold odds of  
886 tuberculosis among HCWs with frequent contact with patients.<sup>22</sup>

887 The risk of developing PTB is significantly higher among those with HIV infection.<sup>23</sup>In our  
888 sample, there was approximately 30.8% of participants who were HIV positive. Although high,  
889 this prevalence reflects that of the South African general population where up to 73% of reported  
890 TB cases have HIV as a comorbidity.<sup>24</sup>In our adjusted models, we did not find an increased risk  
891 associated with HIV. This may be attributed to the fact that many of these CFWs are well-  
892 managed on anti-retroviral therapy. The role of ARVs in mitigating TB risk includes the  
893 strengthening of the immune system, prevention of TB progression from infection to disease,  
894 reduced TB transmission, and the chances of developing drug-resistant TB are diminished.

895 Tobacco smoking has a strong link with a high risk of TB.<sup>25</sup> It is an underestimated risk factor for  
896 TB and it poses a major hindrance to global TB control efforts.<sup>26</sup>This study also revealed a strong  
897 relationship between smoking and PTB disease. Smokers were three times more at risk of being  
898 infected with PTB than those who did not smoke. Through its direct damage to the lung structure  
899 and disruption of the respiratory immunological and cellular functions, tobacco increases the risk  
900 of TB and progression to active PTB disease by about twofold and worsens TB prognosis<sup>27</sup>. A  
901 study in Dhaka central jail, Bangladesh, also reported a strong association between smoking and  
902 TB with 85.7% of prisoners with TB cases smoking at least five cigarettes per day<sup>28</sup>. In Ivory  
903 Coast, 52% of prisoners with TB disease were smokers<sup>29</sup>. Efforts to reduce tobacco consumption  
904 should be encouraged, to decrease the risk of TB and related mortality.

905 According to scientific literature, apart from workplace factors, HIV status and smoking, other  
906 lifestyle factors are established risks for the development of PTB<sup>30</sup>. These include the type of  
907 housing, primary cooking energy source, number of household occupants, number of rooms per  
908 household occupants, and mode of transportation to the workplace. Overcrowding, lack of  
909 ventilation, and other negative practices have been identified as risk factors for PTB disease in  
910 prisons. These factors dramatically increase the transmission risks of TB. Studies have also  
911 shown that conditions prevailing in South African prisons are extremely conducive to the  
912 transmission of TB.<sup>31</sup> In this study, the participants however expressed that the facilities had  
913 adequate ventilation, in the form of open windows and ceiling fans. However, our bivariate  
914 analysis did not show significant relationships between these lifestyle risk factors and was  
915 therefore not included in our regression models. For instance, 82.6% commuted to and from  
916 work in their personal vehicles, thus limiting the likelihood of their exposure to PTB. Within the  
917 home environment, 73% stated that they had an open window policy, thereby allowing for good  
918 ventilation; 81% reported they lived in well-spaced housing locations; 86.16% had good  
919 electricity; 70.12% stated they used electric stoves, rather than charcoal or paraffin stoves. All of  
920 the participants stated they had a good and regular supply of clean water.

921 There were several limitations in the study. The inability to get a larger random sample was a  
922 limitation. This was largely due to the shift structure at the institutions, which meant that many  
923 workers were not available at the same time leading to a smaller population size of participants.  
924 As acquiring PTB disease was not a reportable condition in the workplace, some workers are  
925 likely to have sought health care from private medical services. Hence the total prevalence of TB  
926 in these facilities is not known. Studies have shown that the experience of stigma, along with fear  
927 of breach of confidentiality and privacy, are frequent themes in studies of health workers'

928 attitudes to reporting cases of TB. This reflects a lack of trustworthiness in the system with  
929 concerns over job security.<sup>32,33</sup>

930

931 However, despite these limitations, there are important strengths to the study. Specifically, the use  
932 of a risk assessment tool, validated in a previous study involving healthcare workers provided an  
933 opportunity to assess TB-related workplace risk.<sup>15</sup> It provided more detailed and focused  
934 information on the potential hazards that were present in that work environment. The focus of this  
935 instrument was not on the institution generally, but on the section in which the worker was  
936 deployed at the time of the diagnosis of PTB disease.

937

938 In conclusion, this study is among the few that have documented the risk for occupational TB  
939 among CFWs globally, and the first in South Africa, a known high disease-burden country. CFWs  
940 bridge the transmission of TB from correctional facilities to the community. Routine pre-  
941 employment screening of CFWs on entry into the Department of Correctional Services and  
942 regular periodic check-ups thereafter needs to be implemented in the correctional services.  
943 Likewise, regular PTB screening programmes should be implemented in correctional settings.  
944 Infection control measures, including administrative and personal protection measures, are of  
945 utmost importance in preventing transmission in congregate settings such as prisons.<sup>1,11,12</sup> The use  
946 of Respiratory Protective Equipment (RPE) by all CFWs should also be enforced. Continued  
947 assessment of health risks for CFWs is warranted, given that CFWs may be at risk of exposure to  
948 a variety of infectious agents, because their work setting may present challenges to infection  
949 control compliance. Medium research into occupational exposure and control for this  
950 understudied population of CFWs is strongly recommended. Diagnostic screening in a systematic  
951 approach and appropriate management of both the disease and the infection of PTB among  
952 prisoners and CFWs will be of great benefit to individuals and the general population.

953

#### 954 **Acknowledgements**

955 We appreciate the role played by the following people: the Regional Head: Development & Care,  
956 KZN Regional Office Department of Correctional Services, the Assistant Director at the Glencoe  
957 correctional facilities, Glencoe, the Deputy Director at Fort Napier correctional facilities,  
958 Pietermaritzburg Medium B, the Assistant Director at Westville correctional facilities, Durban,  
959 and all staff of the Department of Correctional Services that participated in the study.

### CHAPTER III

1076

1077

#### 1078 **General Discussion and Synthesis**

1079 This study is hinged on the hypothesis that prison staff are at greater risk than the general  
1080 population of acquiring pulmonary tuberculosis because of their increased workplace risk. Our  
1081 overall objectives were to determine what factors of the workplace (if any) could increasingly put  
1082 CFWs more at risk of contracting PTB disease in KZN prisons.

1083

1084 Relatively more studies have been conducted to highlight the high incidence of PTB among  
1085 offenders as opposed to what obtains in the general population.<sup>6,7</sup> Our study focused on the  
1086 prevalence of PTB among CFWs. The prevalence we obtained was high at 22%. From the results  
1087 of the analysis of data generated, workplace factors increasing the risk of PTB among CFWs  
1088 include TB contact in the working environment, years worked at the facility, and the lack or  
1089 improper use of RPEs. Others are ventilation problems with the prison infrastructure, and non-  
1090 adherence to open window policies.

1091

1092 Close contact with TB-infected persons enhances person-to-person transmission of the infective  
1093 agent, Mycobacterium Tuberculosis. This is further buttressed in the study on prisons and health.  
1094 Here, it was said that the risk of contracting TB rises when several people who are coughing are  
1095 situated in a poorly ventilated room. The risk of transmission of PTB disease in settings in which  
1096 people are in close contact (as in prisons and hospitals) is particularly high. By estimation, about  
1097 30% of those in contact with infected people that inhale the mycobacteria via aerosol droplets get  
1098 infected. However, in situations of overcrowding, like in prisons, the number of contacts  
1099 becoming infected could be doubled.<sup>31</sup> Even though host-related factors like HIV – co-infection  
1100 play a major role in the acquisition of TB; it was not a significant finding in this study.

1101

1102 The number of years that CFWs had been working in their various institutions was also  
1103 significant as a risk factor. The longer the duration of exposure to the infective agent, the more  
1104 likely a susceptible subject will be infected. This was also highlighted in a United States study,  
1105 describing how more likely patients would become smear positive and even develop pulmonary  
1106 cavities due to constant exposure.<sup>32</sup>

1107

1108 There are numerous levels of control usually instituted to eliminate risk factors in the workplace.  
1109 The last level involves the use of personal protective equipment, in this case, RPEs. From this

1110 study, it was noted that CFWs were generally not so compliant with the use of RPEs. This study  
1111 did not go further in interrogating whether or not a fit size or fit check was done, even though  
1112 these are essential in ensuring the efficiency of this level of control. The National Institute for  
1113 occupational safety and health (NIOSH) has estimated that up to 10 – 20% leakage occurs in  
1114 masks not properly fitted to the wearer’s face.<sup>33</sup>A comparable finding in terms of this low  
1115 compliance was found amongst healthcare workers in Indonesia.<sup>34</sup> These are important findings  
1116 as they show the significance of mask fitting.

1117

1118 Regarding the restrictions imposed on features like ventilation in the physical structures of  
1119 prisons, the transmission of PTB disease is enhanced by buildings with poorly designed  
1120 ventilation plans – which is seen in correctional facilities and prisons.<sup>35</sup>In this study, however,  
1121 data revealed that the prison structures in all the centres did have sufficient ventilation systems.  
1122 For instance, the participants all identified numerous windows which were said to be functional  
1123 and sufficient, allowing for proper cross ventilation as well as roomy facilities further enhancing  
1124 ventilation. Because some respondents referred to the availability of air conditioners as possible  
1125 explanation for good ventilation, there is a need to distinguish between air conditioning and  
1126 ventilation. Air conditioning focuses on cooling and dehumidifying indoor air. It also filters and  
1127 removes dust, allergens and other particles. On the other hand, ventilation is primarily concerned  
1128 with the exchange of circulation of fresh air from the exterior to maintain air quality and remove  
1129 contaminants.

1130

1131 These were similar to the findings from a study conducted in Brazilian prisons, that improving  
1132 ventilation has a tremendous effect in cutting down on the risk of transmission daily, thereby  
1133 reducing the infections in prisons.<sup>36</sup> In that study, lack of cross-ventilation was identified as a  
1134 major problem. In terms of ventilation, when considering airborne infection control, cross-  
1135 ventilation is seen to be more effective. This is when there is unhindered ventilation through two  
1136 adjacent openings. Considering that globally, the primary goal of choosing the architectural  
1137 designs of prisons and correctional facility centres is security, these ventilation findings will be in  
1138 keeping with building specifications worldwide – South Africa inclusive.

1139

1140 Other factors which could have contributed to the further spread of PTB disease among workers  
1141 included the mode of transportation to and from work. Quite a large proportion of the participants  
1142 did commute to work using their own personal vehicles, thereby reducing the risks of contracting  
1143 PTB. Those who utilized public transportation for commuting were only 17%. Having live-in

1144 facilities that accommodated family members sufficiently was also examined and it was  
1145 discovered that a sufficient number of the participants identified with living in the urban  
1146 settlement, with their own apartments and thus reducing the chances of overcrowding, which  
1147 could further enhance the spread of TB.

1148

1149 It has been noted that although it is essential to target high-risk populations, inmates are not  
1150 adequately prioritized when it comes to drawing up policies, and neither are prison programs  
1151 amalgamated into the national agenda. Hence, WHO has mandated improved focused efforts  
1152 regarding HIV and TB which include aggressive objectives and goals of being able to identify at-  
1153 risk groups, getting them tested and subsequently treated. This relates particularly to those that  
1154 are in prisons.<sup>37</sup> This, among other programs, is an important intervention strategy for both  
1155 inmates and CFWs.

1156

#### 1157 **Bias and Limitations**

1158 There are additional biases and limitations in our study that are not covered in the previous  
1159 chapter. A bias might have occurred among the CFWs, exhibited by a tendency to report more  
1160 respiratory symptoms, thus overestimating the association between exposure and health  
1161 outcomes. On the other hand, denial of variables like positive HIV status or smoking habits by the  
1162 participants was a possibility while considering social stigmatization or job insecurity, thereby  
1163 creating a bias. This bias is likely to have driven our effect estimates toward the null generally.

1164

1165 As mentioned in the previous chapter, the shift cycles contributed to participation rates and  
1166 possibly introduced a selection bias. Broadly, the staff was divided into day and night shifts. For  
1167 the most part, during the administration of questionnaires, attempts were made to administer  
1168 questionnaires to the CFWs at a point where one shift was ending and the other shift starting. This  
1169 still proved to be a challenge because there was still another group of staff that were off duty,  
1170 having performed their overtime. There was some degree of impatience also exhibited by the  
1171 staff. The night shift staff that was closing were in a hurry to leave, especially because they would  
1172 still be returning in some hours for the night shift. The daytime staff that was taking over wanted  
1173 to clock in and resume work as soon as possible. With the gathering of these two categories of  
1174 staff, it meant that numerous duty posts were left unattended. Hence the possible explanation for  
1175 many questionnaires left either blank or not completely filled. However, as the shifts are  
1176 independent of health status, this is not likely to have influenced our outcomes.

1177

1178 Our study was cross-sectional and therefore most relationships had to be inferred. With cross-  
1179 sectional studies, it is difficult to derive a causal relationship between different variables. It does  
1180 not allow for a conclusion about causation. This method of study is prone to report bias.  
1181 Respondents may not have disclosed certain behaviours out of embarrassment, fear or other  
1182 limiting perceptions. Unfortunately, there is no method for verifying this information. Cross-  
1183 sectional studies are unable to measure incidence.

1184 .

1185 Imprecise estimates (predictions that lack accuracy) usually result from insufficient or limited  
1186 data, inferences based on assumptions, or attempts to analyse complex systems. In our study, we  
1187 did not have to deal with any of these possible causes of imprecision.

1188

1189 Even though ventilation or the lack of it plays a very important role in whether or not TB  
1190 transmission will be continuously propagated, there was no objective method of measuring  
1191 ventilation.

1192

1193 Based on the Malawi study<sup>38</sup> and the Malawian report,<sup>39</sup> we estimated a required sample size of  
1194 360. However, we ended up with a response of 224 and this gave us a power of 0.6 (Appendix G)

## CHAPTER IV

1201

1202

### 1203 **Conclusions and Recommendations**

1204

1205

#### 1206 Conclusion

1207 In conclusion, the prevalence of TB disease among the CFWs in this survey is high (22%). The  
1208 study underscores the fact that there is a high likelihood of attributable occupational TB exposure  
1209 by working in this high-transmission setting.

1210 This high prevalence might be attributable to the following:

1211 1. Risk for job description, with ancillary staff being the highest. This is probably the case  
1212 because they have the highest number in terms of CFW employees. The HCW (including  
1213 the allied health staff) and correctional officials expectedly also had high numbers. This  
1214 is not surprising considering the fact that they had the closest proximity to inmates due to  
1215 their job descriptions and also because TB is transmitted via aerosols.

1216 2. CFWs work within a confined space, due to the emphasis on security. The priority in  
1217 prisons and places of confinement is security and all other considerations are secondary.  
1218 Thus, inmates are kept in confined spaces, and by extension, the CFWs work in these  
1219 confined spaces. This enhances the transmission of infectious agents, in this case, TB.

1220 3. Prisons are recognized as reservoirs of illnesses and diseases, especially infectious  
1221 diseases like TB and HIV. The fact that health care in places of confinement is not  
1222 optimal puts the CFWs at greater risk.

1223 4. Lack of compliance among the CFWs with the use of RPEs. The improper or total lack of  
1224 compliance in the use of this personal protective equipment was noted in the information  
1225 supplied by the respondents. For those who complied with the use, whether or not it was  
1226 fitted and tested before use could not be ascertained. These RPEs are important in the  
1227 prevention of transmission as they confer some degree of protection from aerosols.

1228 5. The number of years of employment in correctional facility institutions. This has a  
1229 bearing as a risk factor because the longer the duration of employment, the greater the  
1230 number of instances that a worker is in close proximity to a TB-infected inmate, and the  
1231 greater the chances of transmission. For CFWs who have been employed longer than

1232 others in correctional services institutions, the chances of acquiring TB are higher with  
1233 increased length of exposure time.

1234 6. Tobacco smoking. This has been linked repeatedly to the increased prevalence of TB  
1235 worldwide. Tobacco smoking in itself is not the direct link, but the fact that it increases  
1236 the chances of contracting the disease. For CFWs already working in a high-risk area  
1237 which increases the chances of contracting TB, those who smoke tobacco are at an even  
1238 greater risk.

1239

#### 1240 **Recommendations**

1241 Routine screening of CFWs on entry into service and regularly thereafter needs to be  
1242 implemented in the criminal justice system. In addition to the routine screening at entry into  
1243 facilities, isolation of presumptive and confirmed cases, infection prevention, and control  
1244 measures, and appropriate diagnosis and treatment for tuberculosis are interventions that should  
1245 be prioritized.

1246

1247 TB Infection control measures are of utmost importance in preventing transmission in congregate  
1248 settings such as prisons.<sup>31</sup> These can be achieved in 4 levels:

1249 • Managerial control measures like avoiding overcrowding of the facilities, operational  
1250 research, monitoring and evaluation, and drafting infection control measures for TB This  
1251 also includes advocating for the constitution of Infection Prevention and Control (IPC)  
1252 committees in the various facilities, and ensuring that they are fully functional, with a  
1253 designated person to act as a “champion”. There is also the need for human resource  
1254 development and education of all staff regarding the prevention of TB.

1255

1256 • Administrative control measures which include screening and expeditious identification  
1257 of TB cases. This involves both passive and active case findings, for instance, the use of  
1258 questionnaires, chest X-ray, tuberculin skin tests, or a combination of these methods.  
1259 Subsequently, there should be prompt patient isolation as required, and health education  
1260 in areas of personal hygiene and etiquette.

1261

1262

1263 • Environmental control measures, especially the fact that structures and buildings should  
1264 be in accordance with ventilation policies. There is a need to ensure adequate ventilation,  
1265 especially capitalizing on natural ventilation. In some instances, whenever conducive,  
1266 these centers could employ the use of local exhaust ventilation, HEPA filtration and  
1267 industrial fans. Another effective form of environmental control targeting these infectious  
1268 agents is the use of ultraviolet irradiation for eradication.

1269  
1270 • Personal protection measures include the provision of respiratory protective equipment  
1271 like masks and ensuring appropriate fitment and leakage testing. There is a need for other  
1272 forms of personal protection like gloves, visors. Hand washing facilities should be  
1273 provided, with either hand towels to dry the hands or air dryers.

1274

1275 Other more specific measures include:

- 1276 1. Address workplace factors that increase the risk of PTB among correctional facility  
1277 workers (CFWs), such as TB contact in the working environment, years worked at the  
1278 facility, and ventilation problems in the prison infrastructure.
- 1279 2. Regional directors and government policymakers prioritize high-risk populations, such as  
1280 prison staff and inmates, in policies and programs aimed at identifying and treating those  
1281 with PTB and HIV.
- 1282 3. Large-scale surveillance programs should be implemented. This allows for regular  
1283 screening, identification of latent cases, early diagnosis, prompt treatment initiation,  
1284 contact tracing, prevention of PTB disease transmission within and outside the prison  
1285 walls, thereby safeguarding both incarcerated individuals and the broader community.
- 1286 4. Increase awareness and education about TB prevention among staff members in  
1287 correctional facilities, with an emphasis on medical and allied staff and ancillary staff.  
1288 This education should also cover the importance of PPE and its correct use.
- 1289 5. Implement measures to minimize exposure to TB among staff members, especially  
1290 medical and allied staff, such as providing them with N95 masks, establishing protocols  
1291 for handling TB patients, and reducing the number of staff members with direct contact  
1292 with TB patients.
- 1293 6. Monitor and evaluate the TB situation in correctional facilities, including the prevalence  
1294 of TB among staff members, the effectiveness of interventions, and the impact of TB on  
1295 the health and well-being of staff members.

- 1296 7. Identify and address other workplace risk factors that may contribute to the development  
1297 of TB, such as smoking, and take measures to minimize exposure to these risk factors.
- 1298 8. Conduct further research on other factors that may contribute to the spread of TB among  
1299 CFWs, such as transportation to and from work and living conditions. Also, further  
1300 research to better understand the relationship between TB and various demographic and  
1301 health-related variables, such as gender, age, and HIV status, to develop more effective  
1302 interventions and strategies to prevent and manage TB in correctional facilities.
- 1303 9. Consider incorporating prison programs into national agendas and improving focused  
1304 efforts on HIV and TB to better identify and treat at-risk groups in prisons.
- 1305 10. Improve infection prevention and control measures: While all three institutions have  
1306 existing TB infection control policies, only one has regular IPC meetings. It is  
1307 recommended that regular IPC meetings be implemented in all institutions to ensure  
1308 compliance with the policies and to identify any gaps that may exist. Furthermore, the  
1309 frequency of cleaning activities such as damp dusting should be reviewed to ensure that it  
1310 is adequate for controlling the spread of TB. Additionally, there should be regular  
1311 training on TB infection control measures for all staff members.
- 1312 11. Improve Respiratory Protective Equipment (RPE) usage: Only one institution provided  
1313 N95 masks to CFWs as RPE, but there was no formal training on the use of the masks nor  
1314 was there any fit testing. It is recommended that formal training on the use of RPE is  
1315 provided to all staff members and that the use of masks be enforced to prevent the spread  
1316 of TB. There should be increased compliance with the use of RPEs to protect prison staff  
1317 from contracting pulmonary tuberculosis (PTB). Management should ensure that RPEs  
1318 are properly fitted and checked for leaks
- 1319 12. Improve ventilation: All three institutions relied on natural ventilation, but only one had  
1320 local exhaust ventilation and industrial fans. It is recommended that all institutions  
1321 consider installing local exhaust ventilation and industrial fans to improve ventilation and  
1322 reduce the risk of TB transmission.
- 1323 13. Improve screening and diagnosis: While pre-employment, periodic and exit TB screening  
1324 is done routinely in all three institutions, there is still a high prevalence of TB among staff  
1325 members. It is recommended that the screening process be reviewed to identify any gaps  
1326 that may exist. Measures also need to be put in place to improve the diagnosis of TB  
1327 among staff members.
- 1328 14. Regional directors need to address socio-demographic factors, for example by improving  
1329 the living conditions and reducing overcrowding in staff members' households, as this

1330 may be a contributing factor to the transmission of TB. There was a higher prevalence of  
1331 TB among those with a household occupancy of more than three members. It is  
1332 recommended that interventions be implemented to address socio-demographic factors  
1333 such as household size that may contribute to the spread of TB.

1334 15. Improve data collection: The study only had a small sample size of 224 participants, and  
1335 only three institutions were included. It is recommended that a larger sample size and  
1336 more institutions be included in future studies to provide a more comprehensive  
1337 understanding of the risk factors associated with TB transmission among CFWs.  
1338 Additionally, the data collected should be more detailed and comprehensive to identify  
1339 any other risk factors that may exist.

1340 Our study was able to achieve the major objective we set out to accomplish – determining the  
1341 prevalence of TB among the CFWs and identifying possible factors that put this category of  
1342 workers at risk. However, there is a need for large-scale surveillance programs.

1488

**1489 RISK ASSESSMENT TOOL FOR WORKING ENVIRONMENTS OF WORKERS WITH**  
**1490 TB**

1491

1492 This risk assessment must be conducted in the working environment of each case of TB that is  
1493 diagnosed in a correctional facility worker at that facility. The risk assessment must be conducted  
1494 by the officer trained to perform the assessment. The focus is not on the institution generally, but  
1495 on the section in which the worker was deployed at the time of the diagnosis of TB [Throughout  
1496 the questionnaire, the section is referred to as the “**affected section**”].

1497

1498 NAME OF PERSON CONDUCTING RISK ASSESSMENT: \_\_\_\_\_

1499 DATE OF RISK ASSESSMENT: \_\_\_\_\_

1500 NAME OF SUPERVISOR IN CHARGE: \_\_\_\_\_

**1501 General information on Facility**

1502 Facility Name: \_\_\_\_\_

1503

1. What type of facility is this?	<input type="checkbox"/> Medium Security <input type="checkbox"/> Maximum Security
2. Where is the facility located?	<input type="checkbox"/> eThekwini <input type="checkbox"/> Amajuba <input type="checkbox"/> Harry Gwala <input type="checkbox"/> ILembe <input type="checkbox"/> King Cetshwayo <input type="checkbox"/> UGu

1508

1509 **WORK ENVIRONMENT**

1510 **ADMINISTRATIVE CONTROLS**

1511 **Occupational Health**

11. Is TB screening done at employment medicals for all categories of workers?	<input type="checkbox"/> Yes <input type="checkbox"/> No
12. Is annual TB screening for staff being done for all categories of workers?	<input type="checkbox"/> Yes <input type="checkbox"/> No
13. Is TB screening being done with exit medicals for all categories of workers?	<input type="checkbox"/> Yes <input type="checkbox"/> No

14. Is there a TB infection control Policy?	<input type="checkbox"/> Yes <input type="checkbox"/> No
15. Is there an assigned person to monitor policy implementation in this prison?	<input type="checkbox"/> Yes <input type="checkbox"/> No
16. Does regular training on policies- prevention of respiratory infections occur in this prison?	<input type="checkbox"/> Yes <input type="checkbox"/> No
17. How often does it occur?	<input type="checkbox"/> Once weekly <input type="checkbox"/> Once monthly <input type="checkbox"/> Once 6 monthly <input type="checkbox"/> Once a year

1512

1513

1514 **Hygiene in the “affected section”**

18. How often is the floor swept?	<input type="checkbox"/> More than twice daily <input type="checkbox"/> Twice daily <input type="checkbox"/> Once daily
19. How often is the floor mopped?	<input type="checkbox"/> Every 2 Hours <input type="checkbox"/> Twice daily <input type="checkbox"/> Once daily
20. How often are the surfaces wiped?	<input type="checkbox"/> Once daily <input type="checkbox"/> Twice weekly <input type="checkbox"/> Once a week
21. How often is the bed linen changed?	<input type="checkbox"/> Daily <input type="checkbox"/> Twice weekly <input type="checkbox"/> Once a week
22. How often are the bins emptied?	<input type="checkbox"/> As necessary <input type="checkbox"/> Twice a day

	<input type="checkbox"/> Once a day
23. Is damp dusting done?	<input type="checkbox"/> Yes <input type="checkbox"/> No

1516

1517

1518

1519

1520 **Patient flow and sputa management in the “affected section” [If the section does not manage**  
 1521 **patients, then go to Question 36]**

24. What are the average working hours per CFW?	<input type="checkbox"/> 8 hours <input type="checkbox"/> 12 hours <input type="checkbox"/> 24 hours
25. Are CFWs screened for TB Symptoms at work?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Sometimes
26. Are coughing CFWs provided with N95 masks?	<input type="checkbox"/> Yes <input type="checkbox"/> No
27. Are there posters educating on cough etiquette	<input type="checkbox"/> Yes <input type="checkbox"/> No
28. Where does sputum collection occur?	<input type="checkbox"/> Outside the building <input type="checkbox"/> Special enclosed area/cough room <input type="checkbox"/> In the sick bay <input type="checkbox"/> In the consulting room <input type="checkbox"/> Wherever it is convenient
29. What is the Turnaround time for sputum	<input type="checkbox"/> <2 days

results	<input type="checkbox"/> 2-7 days <input type="checkbox"/> 1-2 weeks <input type="checkbox"/> >2 weeks
30. Does sputa analysis occur in:	<input type="checkbox"/> A special analysis room in the prison <input type="checkbox"/> In the consulting room <input type="checkbox"/> In the cough room <input type="checkbox"/> Other: _____
31. How are samples stored?	<hr/> <hr/> <hr/>
32. If samples are not analyzed in the section, how are they transported to the analysis department?	<hr/> <hr/> <hr/>

1522

1523

1524 **TB contact**

33. How many staff has been diagnosed with TB in the last 12 months in the prison?	<input type="checkbox"/> None <input type="checkbox"/> 1-10 <input type="checkbox"/> 11-20 <input type="checkbox"/> >20

1525

1526 **ENGINEERING CONTROLS**

1527 **Ventilation**

<p>34. What type of ventilation is available in the prison?</p>	<p><input type="checkbox"/> Natural</p> <p><input type="checkbox"/> Local exhaust ventilation</p> <p><input type="checkbox"/> HEPA Filtration</p> <p><input type="checkbox"/> Industrial fans</p> <p><input type="checkbox"/> Air conditioning</p> <p><input type="checkbox"/> Household fans</p> <p><input type="checkbox"/> Other: _____</p>
<p>35. Is there a service record for air conditioners?</p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>
<p>36. Does the affected section have working fans:</p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>
<p>37. Does the affected section have Windows?</p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>
<p>38. Does the affected section have cross ventilation</p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>
<p>39. Does the affected section have negative pressure ventilation</p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>
<p>40. Does the affected section have doors leading outside?</p>	<p><input type="checkbox"/> Yes</p> <p><input type="checkbox"/> No</p>

1528

1529

1530 **PERSONAL RISK REDUCTION IN THE AFFECTED SECTION**

1531

41. Are N95 masks available?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Sometimes
42. Are N95 masks used?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Inconsistent
43. Are users fit-tested?	<input type="checkbox"/> Yes <input type="checkbox"/> No
44. Are there hand-washing facilities in these areas?	<input type="checkbox"/> Administration <input type="checkbox"/> Waiting areas <input type="checkbox"/> Visiting areas <input type="checkbox"/> Consultation rooms <input type="checkbox"/> Dining areas
45. Are there disposable or air hand dryers?	<input type="checkbox"/> Administration <input type="checkbox"/> Waiting areas <input type="checkbox"/> Visiting areas <input type="checkbox"/> Consultation rooms <input type="checkbox"/> Dining areas
46. Are additional personal protection provided in this section	<input type="checkbox"/> Gloves <input type="checkbox"/> Goggles/visors <input type="checkbox"/> Other: _____

1538

**APPENDIX B**

1539 CONSENT TO PARTICIPATE IN A STUDY: PREVALENCE OF PULMONARY  
1540 TUBERCULOSIS AMONG CORRECTIONAL SERVICES STAFF IN KWAZULUNATAL  
1541 CENTRES

1542

1543 **1. Title of the research project**

1544

1545 Prevalence of pulmonary tuberculosis [TB] among correctional services staff in KwaZulu-  
1546 Natal centers

1547

1548

1549 **2. Introduction**

1550 My name is Adefolarin Fawole, a Master's student at the University of KwaZulu-Natal from the  
1551 Department of Occupational and Environmental Health. I am conducting research on the  
1552 prevalence of TB among correctional services staff in KwaZulu-Natal centers. I would like to  
1553 take a few minutes of your time to determine if you would be interested in being part of the study.  
1554 KwaZulu-Natal has one of the highest prevalence of TB in South Africa. The employees in this  
1555 industry are mostly exposed to TB by virtue of their proximity to the offenders. Correctional  
1556 facilities are regarded globally as reservoirs for TB among other communicable diseases. Studies  
1557 have been conducted on this health concern in other parts of the world. However, there is very  
1558 little information on this in our local setting in KwaZulu-Natal and South Africa as a whole.

1559

1560 **3. Names of the researchers**

Prof. Rajen Naidoo, MB.ChB, PhD	Department of Occupational and Environmental Health, University of KwaZulu-Natal, South Africa Telephone: 031-260 4385; Fax: 031-260 4663
Dr Adefolarin Fawole MBBS	Imbalenhle Community Health Centre, KwaZulu-Natal Department of Health, Pietermaritzburg Telephone: 033-3989100; Fax: 033-3982600

1561

1562

1563

1564

1565 **4. Purpose of the research**

1566

1567 We wish to ask you to participate in an investigation into the prevalence of TB among  
1568 correctional services staff in KwaZulu-Natal centers. The purpose of this study is to determine  
1569 how rampant TB is among the participants.

1570 This will assist in identifying risk factors for the acquisition of TB by correctional services staff  
1571 due to occupational exposure.

1572

1573

1574 **Description of the research project**

1575

1576 If you agree to participate in the study, you will be asked to complete a questionnaire at your  
1577 workplace. A member of our research team will administer a questionnaire to you. You will be  
1578 asked questions about yourself, your health and any chest symptoms that you may have or had  
1579 in the past, other medical illnesses, your smoking history, history of your job with correctional  
1580 services, previous jobs, and your family history. This interview will take about 30 minutes to  
1581 complete.

1582

1583 **5. Risks and discomforts of the research and measures taken to reduce this.**

1584 During the interview, you will be asked personal questions. This may cause you to feel  
1585 uncomfortable. If you are unhappy answering any question, please inform the interviewer.  
1586 Note that you will not be forced to answer any question.

1587

1588 **6. Expected benefits to you and others.**

1589 While conducting this study, if it is discovered that you have a disease as a result of the work  
1590 that you do, and should this be compensable under the law, then we will refer you to an  
1591 appropriate center for further assessment and intervention. Upon completion of the study, a  
1592 report highlighting the main study conclusions will be forwarded to you.

1593

1594 **7. Costs to you resulting from participation in the study.**

1595 The study is offered at no cost to you. If a compensable disease is identified and you need to  
1596 be referred to a specialist unit, we can recommend to you who to see. However, any  
1597 additional costs of such medical visits or treatments will not be the responsibility of the study  
1598 team. The interviews and any other tests that may be necessary will be done during your

1599 normal working hours. We do not anticipate taking up any additional time. However, should  
1600 unexpected delays occur, and you incur additional costs related to the research, this will be  
1601 covered by the research team.

1602

1603

1604 **9. Confidentiality of information collected**

1605 Your name will not appear in any reports on this study. The records of questionnaires and  
1606 other tests will be kept completely confidential and will be seen only by members of the study  
1607 team.

1608

1609 **10. Voluntary nature of participation**

1610 Your participation in this project is entirely voluntary. Even after you give your consent, you  
1611 may refuse to participate in or withdraw from the study at any time without penalty or loss of  
1612 benefits.

1613

1614

1615 **11. Documentation of the consent**

1616 One copy of this document will be kept together with our research records on this study. A  
1617 second copy will be given to you to keep.

1618

1619 **12. Contact person.** This study has received ethics approval from the Biomedical Research  
1620 Ethics Committee, University of KwaZulu-Natal. In addition, permission to conduct the  
1621 study has also been received from the commander of this center. If you require further  
1622 explanation regarding the study or if you have any concerns or answers to further questions  
1623 about the research, your rights, or any problem you may feel is related to the study please  
1624 contact Dr. A.A. Fawole at the following telephone numbers: Tel: (033) 3989100 Cell:  
1625 078 5199950

1626

1627 [If you need to obtain additional information about this study, the contact details of the](#)  
1628 [Biomedical Research Ethics Committee, University of KwaZulu- Natal are as follows:](#)

1629 [Research Office – Tel: \(031\) 260 4769; Fax: \(031\) 260 4609; e-mail: BREC@ukzn.ac.za](#)

1630

1631

1632

1633 **13. Consent of the participant**

1634

1635 I have read [or been informed] of the information given above. I understand the meaning of this  
1636 information. Dr/Mr/Ms \_\_\_\_\_ has offered to answer any questions I may have  
1637 concerning the study. I hereby consent to participate in the study.

1638

1639 I \_\_\_\_\_ (First name & Surname) consent to answering a  
1640 questionnaire.

APPENDIX C

IMVUME YOKUZIMBANDAKANYA OCWANINGWENI: UKWANDA KWESIFO  
SOFUBA EZISEBENZINI ZASEMAJELE EZIKHUNGWENI  
ZOKUKUHLUNYELELISWA KWEZIMILO KWAZULU-NATAL

1. Isihloko socwaningo

Ukwanda kwesifo sofuba [TB] phakathi kwabasebenzi basemajele ezikhungweni zokuhlunyeleliswa kwezimilo KwaZulu-Natal.

2. Isingeniso

Igama lami ngingu Adefolarin Fawole, umfundi weziqo zeMasters enyuvesi yaKwaZulu-Natal eMnyangweni we-Occupational and Environmental Health. Ngenza ucwaningo ngokwanda kwe-TB phakathi kwabasebenzi bezikhungo zokuhlunyeleliswa kwezimilo zasemajele aKwaZulu-Natal. Ngifisa ukucela amaminithi ambalwa esikhathi sakho ukubheka ukuthi ungathanda yini ukuba yingxenye yalolu cwaningo. IKwaZulu-Natal inokwanda okukhulu kwesifo sofuba [TB] eNingizimu Afrika. Abaqashwe kulo mkhakha womsebenzi bavuleleke kakhulu esifeni se-TB ngenxa nje yokusondelana neziboshwa. Amajele emhlabeni uwonke abukeka eyizizinda ze-TB, phakathi kwezinye izifo ezithathelwanayo. Sekwenziwe ucwaningo oluningi ngalesi simo sezempilo esidala ukukhathazeka kwezinye izingxenye zomhlaba. Nokho kunolwazi oluncane kakhulu esimeni sakithi saKwaZulu-Natal naseNingizimu Afrika iyonkana.

3. Amagama abacwaningi

Prof. Rajen Naidoo, MB.CHB, PhD	Department of Occupational and Environmental Health, University of KwaZulu-Natal, South Africa Telephone: 031-260 4385; Fax: 031 – 260 4663
Dr Adefolarin Fawole MBBS	Imbalenhle Community Health Centre, KwaZulu-Natal Department of Health, Pietermaritzburg Telephone: 033-3989100; Fax: 033-3982600

4. Inhloso yocwaningo

1693 Sifisa ukukucela ukuba ubambe iqhaza ekubhekeni ukwanda kwesifo se-TB  
 1694 ezikhungweni zokuhlunyeleliswa kwezimilo emajele aKwZulu-Natal. Inhoso yalolu  
 1695 cwaningo ukuthola ukuthi isidlange kangakanani i-TB kulabo ababambe iqhaza.  
 1696 Lokhu kuzosiza ekukhombeni amajphuzu obungcuphe bokuthola lesi sifo se-TB  
 1697 kubasebenzi basezikhungweni zokuhlunyeleliswa kwezimilo ngenxa yokuvuleleka  
 1698 ngokomsebenzi.

1699 5. Ukuchazwa kwalo msebenzi wocwaningo

1700 Uma uvuma ukuzibandakanya kulolu cwaningo uzocelwa ukuba ugcwalise uhla lwemibuzo  
 1701 emsebenzini jwakho. Ilungu lethimba lethu locaningo lizokukhombisa uhla lwemibuzo  
 1702 ngolimi olulodwa oyolukhethu phakathi kwalezi: isiNgisi noma isiZulu. Uma kwenzeka  
 1703 ukuthi lezi zilimi aziyizo izilimi ozisebenzisayo, sicela wazise umhlwayiwolwazi, oyokwazisa  
 1704 umhlwayiwolwazi wocwaningo omkhulu. Uzobuzwa imibuzo emayelana nawe, emayelan  
 1705 nempilo yakho nanoma yiziphi izinkomba zesifuba ongaba nazo nosuwake waba nazo  
 1706 phambilini, okunye ukugula, umlando wakho wokubhema, umlando womsebenzi wakho  
 1707 nezikhungo zokuhlunyeleliswa kwezimilo, imisebenzi edlule nomlando womndei wakho. Le  
 1708 nhlwayalwazi ithatha cishe imizuzu engama-45 ukuyiqeda.

1709 **6. Ingcuphe nokungakhululeki ngocwaningo nezinyathelo zokunciophisa lokhu**

1710 Ngesikhathi senhlwayalwazi, uzobuzwa imibuzo emayelana nawe. Lokhu kungabangela  
 1711 ukuthi uzizwe ungakhululekile. Uma uzizwa ungakuthokozeli ukuphendula noma  
 1712 yimuphi umbuzo, zicela umazise okubuzayo. Qaphela ukuthi awuphoqelekile  
 1713 ukuphendula noma yimuphi umbuzo.

1714 **7. Okulindeleke ukuba kuzuzwe nguwe nabanye**

1715 Ngesikhathi kwenziwa lolu cwaningo, uma kutholwa ukuthi unesifo ngenxa yomsebenzi  
 1716 owenzayo, futhi uma lokho kubonelelwa ngokomthetho, siyobe sesikwedlulisela  
 1717 esikhungweni esifanele uqhubeke nokuhlolwa nokungenelela. Uma seluqediwe  
 1718 ucwaningo, uyothunyelelw umbiko ogqamisa okuzuzwe ocwanigweni.

1719 **8. Izindleka ongena kuzo ngenxa yokuzibandakanya noncwaningo**

1720 Ucwaningo aluyakuba nazindlekao kuwe. Uma kwenzeka kubonakala ubukhona kwesifo  
 1721 esibonelelwayo, okudinga ukuba wedluliselwe kongoti, siyokuncomela ukuthi ubani  
 1722 ongaya kuyena. Nokho-ke, noma yiziphi izindleko zokwelashwa ezingaphezu kwalokho  
 1723 aziyukuba umthwalo zethimba locwaningo. Inhlwayalwazi nakho koknke okunye  
 1724 ukuhlolwa okunzeka kudingeke kuyokwenziwa ngesikhathi sakho sokusebenza  
 1725 esejwayelekile. Asiboni ukuthi kuyokwenzaka sithathe isikhathi esingaphezulu kwalesi.

1726 Nokho-ke uma kwenzeka kuba nokubambezeleka obekungalindelekile, bese kwenzeka  
1727 wandelwa yizindleko ezimayelana nocwaningo, lokho kuyosingathwa yithimba  
1728 locwaniningo.

1729 **9. Isifuba ngolwazi oluqoqiwe**

1730 Igama lakho angeke livezwe emibikwen yalolu cwaningo. Lapho okuqoshwe khona  
1731 izinhlamibuzo nokunye ukuhlola kuyogcinwa ngendlela eyisifuba futhi kubonqwa kuphela  
1732 amalungu ethimba locwaningo.

1733 **10. Isimo sokuzinikela kwababambiqhaza**

1734 Ukubamba kwakho iqhaza kulo msebenzi kuwukuzikhethela ngokuphelele. Nasemuva  
1735 kokunikeza kwakho ngemvume, ungenqaba ukuzimbandakanya nokuhoxa ocwaningweni  
1736 nanoma ngasiphi isikhathi ngaphandle kokuhlululiswa nokwephucwa inzuzo.

1737 **11. Ukugcinwa kwemvume**

1738 Ikhophi eyodwa yale mvume iyogcinwa ndawonye nokuqoshiwe kwalolu cwaningo.  
1739 Ikhophi yesibili iyonikwa wena ukuba uyigcine.

1740 **12. Ongabathinta**

1741 Lolu cwaningo luthole ugunyazo lwenqubonhle lwe-Biomedical Research Ethics  
1742 Committee, University of KwaZulu-Natal. Ngaphezu kwalokho, imvume yokwenza lolu  
1743 cwaingo itholwe kumphathi waleli jele. Uma udinjga incazelo engaphezu kwale  
1744 mayelana nocwaningo noma uma unokukhathazeka okuthil, noma izimpendulo  
1745 zemibuzo ethile mayelana nocwaingo, amalungelo akho, noma yiphi nje inkinga ozwa  
1746 sengathi imayelana nalolu cwaningo, sicela uthinte u-Dr A.A. Fawole kulezi zinombolo  
1747 ezilandelayo: Tel: (033) 3989100, Cell: 078 5199950

1748 Uma udinga ukuthola ulwazi olwengeziwe ngalolu cwaningo, imininingwane  
1749 yokuxhumana ye-Biomedical Research Ethics Committee, University of KwaZulu-  
1750 Natal, yilena elandelayo: ResearchOffice – Tel: (031) 260 4769; e-mail:  
1751 [BREC@ukuzn.ac.za](mailto:BREC@ukuzn.ac.za)

1752 **13. Ukuvuma kombambiqhaza**

1753 Sengifude [noma sengazisiwe] ngolwazi olungenhla. Ngiyayiqonda incazelo yalolu  
1754 lwazi. UDkt./uMnu./uMs \_\_\_\_\_ uzinikele ukuphendula  
1755 noma yimiphi imibuzo engingaba nayo mayelana nocwaningo. Ngiyavuma lapha  
1756 ukuzimbandakanya nocwaningo.

1757 Mina \_\_\_\_\_ (igama nesibongo) ngivuma ukuphendula  
1758 uhla lwemibuzo

1806 **Occupational Exposures**

20. Does the current section you are working in have working fans?	<input type="checkbox"/> Yes <input type="checkbox"/> No
21. Does the current section you are working in have windows?	<input type="checkbox"/> Yes <input type="checkbox"/> No
22. Does the current section you are working in have cross ventilation?	<input type="checkbox"/> Yes <input type="checkbox"/> No
23. Does the current section you are working have doors leading outside?	<input type="checkbox"/> Yes <input type="checkbox"/> No
24. When in contact with TB suspects or TB cases in your department/working environment at the time of diagnosis, what type of ventilation is used? [ONLY INDICATE THAT WHICH IS WORKING]	<input type="checkbox"/> Natural ventilation via open windows and doors <input type="checkbox"/> Air-conditioning for heat control <input type="checkbox"/> Air conditioning for heat and air filtration <input type="checkbox"/> Fans <input type="checkbox"/> Other (please specify)
25. Does the section/working environment at the time of diagnosis or otherwise follow an open-window policy?	<input type="checkbox"/> Yes <input type="checkbox"/> No
26. What type of ventilation is used on cold days?	<input type="checkbox"/> Air-conditioning units with heating function <input type="checkbox"/> Air conditioning units with temperature control and air filtration <input type="checkbox"/> Fans <input type="checkbox"/> Open windows and doors <input type="checkbox"/> None of the above
27. Have you ever worked in one of the following types of working	

environments, if yes, please indicate the number of years	
a) In a foundry?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
b) In a quarry	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
c) In a pottery?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
d) In sandblasting?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
e) In tunneling?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
f) In drilling?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
g) In mining?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years
h) In any other dusty jobs?	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> _____ years

1807

1808 **Medical history**

1809 Have you ever been doctor diagnosed with the following respiratory conditions?

Diagnosis	Year of diagnosis	Please indicate with (X) if you are currently on treatment for the condition

<input type="checkbox"/> Asthma		
<input type="checkbox"/> Bronchitis		
<input type="checkbox"/> Pneumonia		
<input type="checkbox"/> Lung cancer		
<input type="checkbox"/> Chronic obstructive pulmonary disease (COPD)		
<input type="checkbox"/> Silicosis		
<input type="checkbox"/> Other occupational lung diseases		

1810

28. Have you been treated for recurrent upper respiratory tract infections in the past year?	<input type="checkbox"/> Yes <input type="checkbox"/> No
29. Have you had a cough (regardless of duration) in recent times?	<input type="checkbox"/> Yes <input type="checkbox"/> No
30. Have you been having a fever in recent times?	<input type="checkbox"/> Yes <input type="checkbox"/> No
31. Have you had unexplained weight loss in recent times?	<input type="checkbox"/> Yes <input type="checkbox"/> No
32. Have you been experiencing drenching night sweats?	<input type="checkbox"/> Yes <input type="checkbox"/> No
33. Have you been hospitalized in the past year?	<input type="checkbox"/> Yes <input type="checkbox"/> No
34. Have you ever been diagnosed with TB before?	<input type="checkbox"/> Yes <input type="checkbox"/> No
35. If yes, please complete the table below for each episode of TB	

1811

1812

1813

Type of TB	Method of diagnosis	Duration of treatment	Duration of sick leave

1814

36. Have you ever received any compensation for TB disease?	<input type="checkbox"/> Yes <input type="checkbox"/> No
---	---

1815

37. Do you know your HIV status?	<input type="checkbox"/> Yes <input type="checkbox"/> No
38. If yes, what is your status?	<input type="checkbox"/> Positive <input type="checkbox"/> Negative <input type="checkbox"/> Refuse to share
39. If positive, are you on anti-HIV treatment	<input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Not applicable

1816

1817

1818 **Family history**

40. Do you live with anyone who has had TB in the past year?	<input type="checkbox"/> Yes <input type="checkbox"/> No (proceed to question 44)
41. Regarding this person's treatment, has he/she	<input type="checkbox"/> Completed TB treatment <input type="checkbox"/> Currently taking TB treatment <input type="checkbox"/> Did not complete TB treatment
42. Regarding the type of TB, was the diagnosis pulmonary or extra-pulmonary?	<input type="checkbox"/> Pulmonary TB <input type="checkbox"/> Extra-pulmonary
43. Was the TB drug-sensitive or resistant?	<input type="checkbox"/> Drug sensitive <input type="checkbox"/> Drug-resistant <input type="checkbox"/> Unknown

1819

1820 **Social factors**

1821 44. What type of housing do you occupy?

<i>Type of housing</i>	<i>Number of occupants</i>	<i>Number of rooms</i>	<i>How many people do you share your bedroom with?</i>
Formal Housing (Urban)			
Rural Housing			
Hostel			
Informal Housing			

1822

45. How many of the occupants are children under 12 years old?	_____ number
46. Are the houses situated close together (clustered)	<input type="checkbox"/> Yes <input type="checkbox"/> No
47. Does the house have the following: (mark all that apply)	<input type="checkbox"/> Water <input type="checkbox"/> Electricity <input type="checkbox"/> Sanitation facilities (toilets) <input type="checkbox"/> Electric stove <input type="checkbox"/> Gas stove <input type="checkbox"/> Paraffin stove <input type="checkbox"/> Wood stove
48. Does the house have windows?	<input type="checkbox"/> Yes <input type="checkbox"/> No (proceed to question 50)
49. Are all windows open?	<input type="checkbox"/> During daylight only <input type="checkbox"/> Both day and night <input type="checkbox"/> Not opened as air-conditioners or fans are used
50. Have you ever smoked?	<input type="checkbox"/> Yes <input type="checkbox"/> No (proceed to question 58 )
51. Are you a	<input type="checkbox"/> Current smoker <input type="checkbox"/> Ex-smoker
52. At what age did you start smoking?	_____ age
53. If you are an ex-smoker, at what age did you stop smoking?	_____ age <input type="checkbox"/> Not applicable

54. If you are a current smoker, how many cigarettes are you smoking per day now?	_____ number <input type="checkbox"/> Not applicable (ex-smoker)
55. If you are an ex-smoker, how many cigarettes did you smoke per day?	_____ number Not applicable (current-smoker)
56. For how many years did you smoke this amount of cigarettes?	
57. Have you ever smoked other products such as cigars or tobacco pipes?	<input type="checkbox"/> Yes <input type="checkbox"/> No
58. What is your daily mode of transport?	<input type="checkbox"/> Personal vehicle <input type="checkbox"/> Public transport (bus) <input type="checkbox"/> Public transport (minibus taxi) <input type="checkbox"/> Public transport (train) <input type="checkbox"/> Walking <input type="checkbox"/> Cycling <input type="checkbox"/> Other
59. About how many people are in the same vehicle whilst being transported?	<input type="checkbox"/> <5 <input type="checkbox"/> 5-10 <input type="checkbox"/> 10-15 <input type="checkbox"/> >15
60. What type of ventilation is used during the commute?	<input type="checkbox"/> Open windows <input type="checkbox"/> Air-conditioner <input type="checkbox"/> Fan <input type="checkbox"/> None
61. Do you often find that the other passengers are coughing?	<input type="checkbox"/> Yes <input type="checkbox"/> No

1878 [fawoleayo@email.com](mailto:fawoleayo@email.com)

1879 Dear Dr Fawole

1880 Protocol: Prevalence of pulmonary tuberculosis among correctional services staff in

1881 KwaZuluNatal prisons.

1882 Degree: MMDS

BREC Ref No: BE336/i8

1883 EXPEDITED APPLICATION: APPROVAL LETTER

1884 A sub-committee of the Biomedical Research Ethics Committee has considered and noted your  
1885 application received 25 May 2018.

1886 The study was provisionally approved pending appropriate responses to queries raised. Your  
1887 response received on 18 December 2018 to BREC correspondence dated 18 July 2018 has been  
1888 noted by a subcommittee of the Biomedical Research Ethics Committee. The conditions have  
1889 been met and the study is given full ethics approval and may begin as from 28 January 2019.  
1890 Please ensure that site permissions are obtained and forwarded to BREC for approval before  
1891 commencing research at a site.

1892 This approval is valid for one year from 28 January 2019. To ensure uninterrupted approval of  
1893 this study beyond the approval expiry date, an application for recertification must be submitted to  
1894 BREC on the appropriate BREC form 2-3 months before the expiry date.

1895 Any amendments to this study, unless urgently required to ensure safety of participants, must be  
1896 approved by BREC prior to implementation.

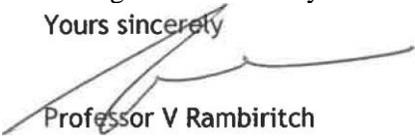

1897 Your acceptance of this approval denotes your compliance with South African National Research  
1898 Ethics Guidelines (2015), South African National Good Clinical Practice Guidelines (2006) (if  
1899 applicable) and with UKZN BREC ethics requirements as contained in the UKZN BREC Terms  
1900 of Reference and Standard Operating Procedures, all available at  
1901 <http://research.ukzn.ac.za/ResearchEthics/Biomedical-Research-Ethics.aspx>.

1902 BREC is registered with the South African National Health Research Ethics Council (REC-  
1903 290408-009). BREC has US Office for Human Research Protections (OHRP) Federal-wide  
1904 Assurance (FWA 678).

1905 The sub-committee's decision will be noted by a full Committee at its next meeting taking place  
1906 on 12 March 2019.

1907 We wish you well with this study. We would appreciate receiving copies of all publications  
1908 arising out of this study.

Yours sincerely

1909 Professor V Rambiritch
